Subject: Re: [UV-3R] Wide/Narrow settings.

☐
I'm going to guess that it is likely intermod.
The UV3R's are not great at intermod rejection.
So, it would stand to reason, that both radios would cut out at the same time, in the same location, if they were receiving strong intermod signals.
Even if you have an RX tone programmed in, as soon as you are receiving the repeater output signal, the receiver of the UV3r is open, and will receive the intermod just like if you had no tone programmed for rx.
Putting the UV3R beside my Icom IC T90A, using similar antennas, and listening to the same repeater output, I often hear the intermod coming in underneath the repeater's strong signal on the UV3R, and not on the Icom.
So, again, I suspect it's merely an intermod rejection issue and nothing more.

Another interesting point, the software is different from the Mark I to the Mark II? Meaning I'll need two separate programs to program the Mark I and Mark II!

Actually, I think somebody reported that you can program both the Mark I and Mark II with the new software, but that's not the case with the original software. That would make sense.

Both my new Mark II and the cable are set to arrive soon, though, so I can confirm that for another day or more.

2129. Printout Question

Yahoo group: UV-3R (2011)
Date: 2011-09-22 16:17:36 UTC
From: DavidO
Topic: 2129 Message: 2129

A printout of a UV-3R mask using software Version 1.01.01 shows a blank column labelled "Description".

In the actual program there is no place to enter "Description" information.

Am I missing something?

Thanks,
Dave - W1WBZ

Yes, I wondered the same thing! Looks like you can't do it.

Actually, I keep a list of all my local/travel repeaters as a spread sheet with annotations, etc.,and then use this to program my various HTs. Not as convenient, but...

Thanks for posting the Wide/Nar info. I am not sure what use the Narrow would be for ham use but does anyone know if FRS channels use 2.5 Hz deviation? I looked it up once to check the difference between FRS and Ham rigs, I am not sure if GMRS chan are Narrow or not? Anyone else know this off hand?

Some motorcycle touring communication is done with FRS or GMRS for those that want longer range than bluetooth.

2136. Let's compare our serial numbers to check faults in the production...

Yahoo group: UV-3R (2011)
Date: 2011-09-22 19:28:41 UTC
From: nochswl
Topic: 2131 Message: 2136

Hello radiofriends,

this week I get my radio from the (german) custom authorities without any further questions about license or intentional use, they don't care about the "CE" or any other facts.
I'm lucky :-)

I examine it:

No fault of the low NF volume, the volume in lowest step is acceptable, loudest step also, communication and broadcasting.
No faults with low signal in TX, my voice is clear and understandable, (tested alone with an PMR 446 radio).
No problems with using the 440 MHz antenna in the 144 MHz-band,
the 144 MHz antenna works good in 440 MHz also.

The volume by pressing [F/A]+[VOL] becomes changeable 10 seconds,
after than the function of the dialing knob resets to channel adjusting.

Unfortunally it's not possible to lock the keypad [F/A]+[MENU] AND scan the frequencies / stored channels.

My radio has other menu descriptions:
Menu 5 in the manual described as "KTONE" (page 12+20),
but is "BEEP" in my radio.
Menu 17 in the manual described as "ELAYM" (page 28),
but it is "RELAYM"
The manual described the step width (menu 9) as 12.5/25 kHz,
but it is 5.00/6.25/10.00/12.50/20.00/25.00 kHz

FM radio function (page 30) will NOT be activated by pressing the button [POWER] but by the button [L/R].

RESET can be done by TWO ways:
Described in manual: Pressing [ON/OFF]+[F/A] both
AND
Pressing [ON/OFF]+[VOL/MON]
Both ways restore to the factory settings.

Useful hint:
If the keytone (#5 "KTONE" or "BEEP") is deactivated, the ALERT signal (siren) is quiet, the radio sends only a carrier.
(To stop press PTT).

My serialnumber is 31106133xx, maybe the manufacturer changes the electronics without notice his dealers.

IMHO it could be wise to buy only the newest Mark I and not an used item.
I don't know how many of the coloured radios they sell, but it could be less than the black

ones.
This can result in older level of development than the black ones.

are you refering to option 12 in the menus?
On mine this is called STE.
It's a very common setting for commercial radios.
Essentially what it is doing, is holding the transmitter open for perhaps 100MS after you actually release the PTT button. I'm not sure exactly how long the hold is.
Once you release the PTT button, the transmitter is held open for a small interval, but the TX tone is also terminated with the release of the PTT. What this does is helps to eliminate squelch bursts when unkeying on a commercial repeater.
However, what is happening in your case, is that when your local ham repeater no longer hears the TX sub tone in your carrier, it is telling the repeater that you are done and sends out the "roger beep" or better known as the curtesy tone. The repeater thinks you are done talking, or that you have unkeyed the radio when it no longer hears the sub audible tx tone in your transmission. So, your radio is holding open the transmitter, but the repeater is already thinking your done and so you don't hear the curtesy tone because your rig is still transmitting.
I just make sure mine is turned off and there is no problem that way.
No ham radio, actual amateur radio, I know of has this feature built in, but almost every commercial radio I've seen has this option.
Not sure why it is called "LAM" on your radio.

2138. Experience so far with Mark II

Yahoo group: UV-3R (2011)
Date: 2011-09-22 19:50:06 UTC
From: aubreycttx
Topic: 2138 Message: 2138

I bought a UV-3R several months ago and have been fairly satisfied with it even though it was one of the original '12 menu' versions. When I saw the Mark II I thought it would be nice to upgrade.

I ordered a Mark II from HK via eBay (seller jaco3378 aka 409Shop) on September 7th and received it yesterday (right at two weeks, which is typical for items delivered to the Dallas/Ft. Worth area from HK).

Right out of the box I had it working on a local UHF repeater. I like the new dual-band antenna as it is not only functional but fits the overall look-and-feel of the radio (I scrounged up an old dual-band antenna for my original UV-3R, which while functional looks like crap).

I also like the fact that the two-line display allows for displaying the menu name and the value you're editing.

I just finished programming it with the software, and it went smoothly without any hitches. I used a USB cable from 409Shop along with the USB drivers and the latest Mark II programming software (UV-3R v1.08) from the 409Shop website. The system I used is running Windows 7 Professional 64-bit. After installing the driver and software I inserted the cable and it was immediately recognized and assigned to COM3. I started the software, set it to COM3, and read the radio to save off an initial file (just in case of later problems).

One small quirk I observed is that when you tell the software to read or write from the radio it will display a small dialog box with a progress indicator. You must press 'OK' before it will actually start communicating with the radio (if you don't realize this you may think that it's stuck and can't connect to the radio).

The other quirk with the software is that for some reason Windows 7 is showing the UV-3R uninstaller in the 'Start' menu. To actually run the program you have to expand "All Programs," then the "UV3R" program group to access the program.

The program is in English and everything looks normal (i.e. no Chinese characters or ???) but the uninstaller appears to have some non-English characters in its Start menu entry.

Some other observations about the Mark II I received:
* The manual is for the Mark I and still references separate antennas

* The charger cradle appears to still be the same dumb one I got with the Mark I(*)

* My Mark II does not have any indicators on the screen when the battery is charging (the light on the wall wart will go from red to green when done, though).

* As far as I can tell, when in memory mode, only the top frequency line uses memories. The bottom frequency line seems to be VFO only. But perhaps I am missing something.

(*) I bought an NP-60 battery charger from Amazon that I use to charge the batteries so I don't have to rely on the base/cradle that came with the unit.

Topic: 2131 Message: 2139

remember, the manual is a translation from a chinese language, into english, and then from english into what ever other languages might be available.
The common term we use over here for this kind of manual is "chinglish".
Much of the meaning and detail and specific phraseology can get lost in chinese to english translations.
Especially if said translation is done electronically, and is not then proofed by a competent human chinese to english translator.

In my manual, it says something like "come to item 4" or something similar when describing the menus.
I think it's more of a general guide than a real technical manual hi.

Subject: [UV-3R] Let's compare our serial numbers to check faults in the production...

Hello radiofriends,

this week I get my radio from the (german) custom authorities without any further questions about license or intentional use, they don't care about the "CE" or any other facts.
I'm lucky :-)

I examine it:

No fault of the low NF volume, the volume in lowest step is acceptable, loudest step also, communication and broadcasting.
No faults with low signal in TX, my voice is clear and understandable, (tested alone with an PMR 446 radio).
No problems with using the 440 MHz antenna in the 144 MHz-band,
the 144 MHz antenna works good in 440 MHz also.

The volume by pressing [F/A]+[VOL] becomes changeable 10 seconds,
after than the function of the dialing knob resets to channel adjusting.

Unfortunally it's not possible to lock the keypad [F/A]+[MENU] AND scan the frequencies / stored channels.

My radio has other menu descriptions:
Menu 5 in the manual described as "KTONE" (page 12+20),
but is "BEEP" in my radio.
Menu 17 in the manual described as "ELAYM" (page 28),
but it is "RELAYM"

The manual described the step width (menu 9) as 12.5/25 kHz,
but it is 5.00/6.25/10.00/12.50/20.00/25.00 kHz

FM radio function (page 30) will NOT be activated by pressing the button [POWER] but by the button [L/R].

RESET can be done by TWO ways:
Described in manual: Pressing [ON/OFF]+[F/A] both
AND
Pressing [ON/OFF]+[VOL/MON]
Both ways restore to the factory settings.

Useful hint:
If the keytone (#5 "KTONE" or "BEEP") is deactivated, the ALERT signal (siren) is quiet, the radio sends only a carrier.
(To stop press PTT).

My serialnumber is 31106133xx, maybe the manufacturer changes the electronics without notice his dealers.

IMHO it could be wise to buy only the newest Mark I and not an used item.
I don't know how many of the coloured radios they sell, but it could be less than the black ones.
This can result in older level of development than the black ones.

2140. editing the .dat file for the UV3r programming software

Yahoo group: UV-3R (2011)
Date: 2011-09-22 20:23:27 UTC
From: colin McDonald
Topic: 2140 Message: 2140

I am wondering if anyone has been successful in editing the .dat format file that contains the programming info for the UV3r.
Other .dat files I have seen are in plain text, and can be edited using word pad or note pad, saved and then imported back into the software they were created by.
When I open the .dat file from the UV3r software, it's jibberish...nothing is in plain text.
So I just wonder if anyone has been able to edit a plain text file, save it as a .dat extension then load it into the UV3r software and write that to the radio?
I know with other HT programming software, IE some of the RT systems stuff, you can import an Excel spread sheet or similar type of document into the program and use that to write the info to the radio.

I have a .3R file from my Mark II that I just took a look at using 'od -hc' in Linux. From what I can see, the data is in a proprietary binary format.

Here's an example of what you see in the file:

```
0000000 4b48 2d54 5233 5220 6461 6f69 5020 6f72
H K T - 3 R R a d i o P r o
0000020 7267 6d61 6420 7461 2061 3176 302e 0038
g r a m d a t a v 1 . 0 8 \0
0000040 0000 0000 0000 0000 0000 0000 0000 0000
\0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0 \0
*
0000100 4000 1464 0000 0000 0000 00c0 ffff ffff
\0 @ d 024 \0 \0 \0 \0 \0 \0 300 \0 377 377 377 377
0000120 5000 4410 0000 0000 0000 00c4 3225 0045
\0 P 020 D \0 \0 \0 \0 \0 \0 304 \0 % 2 E \0
```

Interestingly enough, I can actually make some sense of it, as the first two memory locations have 146.440 and 441.050 in them.

Anyhow, you would not be able to easily edit this with a text editor.

If you want to be able to export and import with the UV-3R you might want to look into CHIRP, which recently added support for the UV-3R (note that I haven't personally tried it, as I got mine working with the UV-3R software).

The battery display issue is only when charging while the radio is OFF.

There is the standard battery display when the radio is on.

As for the dual display, note that I've only had it a day. It may be possible to get dual-memories to display on it. I need to search the group, as I think someone commented on this earlier.

But even if it is only capable of working with one memory on the display I think the Mark II is enough of an improvement to be worth it. One must maintain a little perspective when dealing with these inexpensive radios.

I just confirmed that the the bottom display is VFO-only regardless of memory mode.

Here's the thread on the Mark II that I got that from:
http://groups.yahoo.com/group/UV-3R/message/2095

Regardless, it's still a great radio, and an incremental improvement over the Mark I.

one just has to look at the membership numbers on this list to know they are becoming hugely popular...this is one of the largest yahoo groups I've ever been on, and it's only been active since april of this year.

I'm guessing, by the international members on this list, and from reading forums on the internet, that the UV3r's are far more popular in europe than in the US at this stage...especially the UK where it seems allot of people use them for PMR and other public frequency use.
I have come to expect the incrimental upgrade thing from the chinese radio makers. At least they do upgrade them, if slowly. Think of the other major amateur and commercial HT manufacturers and tell me that they release upgraded models of their radios as often as baofeng, wouxun and other chinese manufacturers.

ok, thanks for that.
It would seem as though it won't be as easy as I was hoping.
I see the saved settings file as a .dat, not a .3r file, I guess that is one of the differences between the UV3R MK I and the MK II.

In the UK quite a number of repeaters are narrow deviation so they can be slot into 12.5kHz channels. Our local one GB3OA is on 144.6125Mhz for example.

Using the wide setting for transmitting into a narrow devaition repeater will over deviate it, and gives a lot of distortion, so the narrow setting is quite useful in the UK at least.... (this also goes for transmitting on simplex too).

Regards, .d. G4TUP.

2153. Re: Mark I vs Mark II

Yahoo group: UV-3R (2011)
Date: 2011-09-23 12:50:36 UTC
From: szabi_o
Topic: 2151 Message: 2153

Hi Tom, welcome to the group.

MarkII has 2 line display, and a single dualband antenna.
73, Szabi.

LCD much bigger in Mark II, also this version shipped with one antenna,
instead two antennas in first version

It's very similar to the one you linked, although it only has a U.S. plug. But, like yours, it also has a 12V vehicle plug.

Here's the one I bought:

2156. 2 wire earpiece

Yahoo group: UV-3R (2011)
Date: 2011-09-23 14:25:31 UTC
From: Steve
Topic: 2156 Message: 2156

I have had very good performance with the 2 wire mic/earpiece on the Wouxun. It is much more compact and functional IMHO to use than the speaker mic(with or without the earpiece) The single line earpiece coming with the Baofeng, while functional, falls short of the 2 wire piece. Has anyone found a Baofeng 2 wire supply or built an adapter to use with the vx-2/3R 2 wire?

Okay, here's my question. Can I use a speaker plug to an external speaker and still use the built-in mic?

I've got a 2-band mobile antenna with a mag-mount that I plan to use, as soon as I get the bnc-converter plug, which I ordered with my new Mark II. I want to use the Mark II in my car with the mag-mount antenna, but play the audio over my stereo, which has an auxiliary audio-in plug. But, I still want to use the built-in mic on the unit.

Can I do that?

With my top down in my Saturn Sky convertible, I cannot hear the audio from my UV-3R on full high. Too much wind noise--but I got a crankin' stereo that would work great, if I can get the audio to it.

I don't think it will be possible to run it like that, also you need to be careful plugging a mono plug into the radio.

On another note did your tracking information change? Let me know as soon as you get your radio so that I could anticipate the arrival of mine.

Hi Darvel. Just had a look at the schematic and no it's not possible to do it with a 4-pin plug suitably wired unfortunately. You could do it with a wire soldered across inside the UV-3R though....

You've probably thought of the following, but won't you get quite a bit of wind noise on the UV-3R mic. with the top down?

Regards, .d. G4TUP.

Hmm, that's a good point, David. I guess this opens up a whole new line of experimenting dealing with the sensitivity of the UV-3R mic and/or speaker-mic.

I'm generally more interested in listening while I'm driving tho. My duty cycle, or ratio between listening and transmitting, is pretty highly weighted toward listening.

I want to try it now, though. Thanks for the comments, tho.

2164. MTC version of UV-3R on eBay

Yahoo group: UV-3R (2011)
Date: 2011-09-23 16:28:31 UTC
From: Darvell Hunt (N7LN)
Topic: 2156 Message: 2164

For those in the U.S., there is now an eBay vendor in Texas, maintradingcompany, selling his own version of the UV-3R, with the label of MTC (maintradingcompany).

It looks as if he ordered a bulk lot of UV-3R's and added his own logo. He has a bid of $55 and Buy-it-Now of $61 with free shipping, which isn't too much more than Hong Kong shipping, but is probably considerably faster. Plus it's a U.S. vendor, if that matters to you.

Just another option--if that's worth an additional fifteen or twenty bucks. You can find him by searching "MTC UV-3R" (I don't have any experience with him and have not ordered from him, BTW.)

Topic: 2156 Message: 2167

Would this work?
http://www.ebay.com/itm/Yaesu-CT-91-2-pin-mic-adapter-CT91-VX-7R-VX-6R-adaptor-/350221823668

It looks like an adapter that works on the yaesu products and separates the single jack into two separate jacks then you can choose to connect an external speaker in just the speaker jack part.

I don't know for sure cause I don't know if they are wired like the YAesu products inside of the Baofeng UV-3R

There is also this one:
http://www.ebay.com/itm/Yaesu-CT-44-mic-adaptor-VX-1R-VX-2R-VX-3R-VX-6R-/180481798270?_trksid=p4340.m263&_trkparms=algo%3DSIC%26its%3DI%252BC%26itu%3DUCI%252BIA%252BUA%252BFICS%252BUFI%26otn%3D15%26pmod%3D350221823668%26ps%3D63%26clkid%3D2987786400208098365

Again, not knowing how they Baofeng is wired I can't tell for sure.

2168. Re: [UV-3R] Mark I vs Mark II

Yahoo group: UV-3R (2011)
Date: 2011-09-23 18:01:12 UTC
From: Tom Chesek
Topic: 2151 Message: 2168

When I ordered mine I didn't realize that there were 2 versions. Looking at the pictures on eBay I can't see where the Mark II display is any larger than the Mark I, it only looks like the font style is different to display 2 lines. Does anyone have both versions to compare side by side? Other than a dual band antenna what functionality differences are there?

Thanks again,
Tom K3TVC

Subject: Re: [UV-3R] Mark I vs Mark II

LCD much bigger in Mark II, also this version shipped with one antenna, instead two antennas in first version

Hi, I received my MKII today. I'm very happy with that is much better than the other. The volume issue are now ok, even with the earpiece is ok. Now we could have two frequencies in display but is not new, the new and very good thing is that we could have acess to one frequency from the memories and the other from vfo mode, this is really very good. Every chinese dual band only give acess to channels in vfo mode or in memory mode. For now the bad think that I found is the manual, it is for the old version.

Don't believe so as 2 of the 4 poles are reversed in Yaesu vs Baofeng.

and, I presume, since amateurs haven't done much narrow conversion yet in North America, that as long as the repeater is narrow, and all the radios talking to it are narrow, then there isn't an obvious difference between narrow and wide?
If all radios are wide, they sound fine, and if all radios are narrow, everything sounds the same right? The issue is when a wide radio is trying to talk to a narrow radio and vice versa?
I know most of the new stuff has narrow settings availible, but we just don't use them yet over here on the ham bands.

Colin,

I understand coordinators are or soon will be requiring that new repeaters be narrow and existing repeaters may be urged to move to narrow so spectrum can gradually be recovered. The issue is probably most pressing in and around larger metro areas

From: Darvell Hunt (N7LN)
Topic: 2107 Message: 2175

I believe the U.S. FRS/GMRS frequencies in the 462/467 range use the 12.5khz spacing. Interestingly, since the UV-3R has this setting AND covers this frequency range, if the low power setting is less than a half of a watt, it MAY be legal to use the UV-3R in the FRS band. I don't know what the low power setting puts out, though.

Also, if you have a GMRS license, I think you can go up to 5 watts, so even the high power setting would be legal. I don't know if there are other legalities of using a radio like this in the FRS/GMRS band, though, so don't quote me on that.

a couple things:
The last time I looked, GMRS was still using 25K type spacing. FRS does use 12.5 though.
If you have an GMRS license, I think you can use FRS frequencies using a radio with a removable antenna, up to a power limit of 2W on channels 8-14 on FRS.
Otherwise, within the FRS channels, you must use .5W on a radio with a fixed, 0DB gain antenna...
The hybrid FRS/GMRS type radios alter this a little bit...I think on channels 8/14 you can use 2W output without a GMRS license...it's been a while since I read all that stuff about FRS/GMRS.
We don't have GMRS in canada officially, but allot of people import GMRS radios from the states thinking they are legal here and use them on frequencies that are otherwise designated for commercial usage.
We get allot of the 22 channel hybrid radios here which include the regular 14FRS channels, along with the 8 GMRS simplex/repeater input frequencies. Not strictly legal, but they sell them everywhere.
I think Industry canada is in the process of reallocating some UHF frequencies to the public which include the 8GMRS frequencies so that they may be legally used in Canada without a license.
It's still a few years away, but I think IC is also looking at alocating a CB band on UHF similar to the australian UHF CB band and much like most other countries in the world.
We really don't have any commercial stuff up in the 470/480MHZ range, so they could easily reallocate a 40 or 80 channel CB band up there.

we might have our very own Sidney 7.

Subject: Re: [UV-3R] Re: Wide/Narrow settings.

I believe the U.S. FRS/GMRS frequencies in the 462/467 range use the 12.5khz spacing. Interestingly, since the UV-3R has this setting AND covers this frequency range, if the low power setting is less than a half of a watt, it MAY be legal to use the UV-3R in the FRS band. I don't know what the low power setting puts out, though.

Also, if you have a GMRS license, I think you can go up to 5 watts, so even the high power setting would be legal. I don't know if there are other legalities of using a radio like this in the FRS/GMRS band, though, so don't quote me on that.

Folks... Bear in mind, the UV-3r is *totally illegal* for use on FRS and GMRS! BOTH of these services REQUIRE specific FCC type Acceptance for either Part 95A (GMRS) or Part 95B (FRS)

Since these radios are front-panel programmable, this definitely rules them out in the USA and Canada on GMRS, as well as the US FRS.

You all need to check the regs.

In Canada, GMRS is allowed. See Industry Canada site for details

I think that using UV-3R as unlicensed FRS radio is not legal, because FRS radios are limited to 500 milliwatts according to FCC regulations, guys from Russian forum measure that transmitted power is 2.3/1.6W (Hi/Lo) at 440000kHz with 3.7V power, 3.0/2.2W with 5.0V external power and 4.3/2.4W at 5.3V

exactly.
I forgot about that thing on the IC website where they say it's ok to use the 8 GMRS channels found from channels 15-22 on a "hybrid" FRS radio.
But we still can't aquire a GMRS license in canada and run repeaters and high output HT's/mobiles yet.

Well, there ya go! I guess that settles it.

It seems to me that all the stores in the U.S. sell the GRMS radios as "expanded channel FRS" radios and most people who buy them don't know the different nor do they get the GMRS license. Sales literature doesn't always specify what FRS and GMRS really is, and I'm not sure the instructions that come with these radios do, either--or if they do, I doubt people read them.

In any case, I guess there's nothing illegal about being able to monitor the channels on a UV-3R.

I looked up the GMRS license info on the FCC site and apparently it costs $85 for five years. Even so, with the license, I guess if the radios aren't approved from GMRS band, you can't use them.

I wonder how anybody would tell, though? Do officially approved radios broadcast a special tone or something to identify them? I guess they could.

Hello,

I have just bought a new radio and have the same problem.

After I click 'program', programming fails and the radio locks up and then resets 10 seconds later. I have tried a range of machines, checked the comm port settings and tried to load various existing .dat files and tried chirp.

Has anyone any suggestions, or should I get replacement from 409shop.com?

Also, has anyone experience of getting replacements from them?

Thanks
Darren

The tone "brust" 1750hz is produced by sending a beep tone through the loudspeaker while the TX is keyed.
It modulates from loudspeaker to microphone.
You removed the source of all beeps to the loudspeaker.

Technically to be totally legal the Type Acceptance would be required. Some of the motorcycle tourists I know use GMRS radios and one person I know of followed the directions and sent the license form in with the fee. I thought he said it was lower $$ but it could have changed or ? The motorcycle guys like the higher power in case someone has a breakdown or makes a wrong turn.

I will remember to change to the Nar setting though if I would decide to listen on those frequencies. I do have two Kenwood FRS radios and would be tempted to compare if I needed a 3rd one for some reason. When the kids were still living with us they were useful for shopping or festivals with the kids. Of course now ALL kids have their own cell phones it seems.

Exactly correct Colin. If you come to the UK you'll find that quite a number of repeaters are narrow, and also one-to-one QSO operators are using the 12.5kHz channels. Anyone who just uses a 25kHz step can miss quite a number of QSOs in the major cities....

However, as we know, the big three manufacturers don't tend to use a narrow filter in their HTs when in narrow mode, so with those you can hear splatter from a 25kHz channel. This is where our UV-3Rs score, as they do use a narrow filter..... :)

BTW, on the subject of power output, the PA MOSFETs datasheet states that they can put out 6w with 6v on the source pin. But there may not be enough heatsinking for this, should anyone wish to do a mod.... :)

2195. Re: [UV-3R] Tone-off mod

Yahoo group: UV-3R (2011)
Date: 2011-09-25 10:51:34 UTC
From: DavidN
Topic: 2188 Message: 2195

This was covered about three or four weeks ago. The answer is to reduce the value of R10, and also add a resistor and decoupling capacitor so that the 1750Hz tone is fed directly into the mic input on the 1842 chip. This is reasonably easily done as there are holes in the PCB, as though the manufacturers were going to do this but didn't. Then you get all key tones reduced through the loudspeaker and earpiece, but the 1750Hz (*see later) tone transmitted at fulll level for repeaters.

The answer came from DD5XL:

*Increasing R10 will both affect the 1750Hz and the key beep. I've changed R10 up to 660k (2x 330K 0805) and found the beeps in the speaker now acceptable level.

But with increasing R10 to such a high value, the 1750Hz on TX is much too low now for certain repeaters. So I decided to feed the 1750Hz directly into the modulation input of the RDA1846:

I've populated C47 with a 100nF 0402 for DC decoupling and placed a 220K 0402 for R46. This seems to give an approbiate loud 1750Hz tone directly injected. Another benefit now is that the 1750Hz is available even with the earpiece plugged in.*

Note that the 1842 chip with the 4MHz master oscillator cannot deliver 1750Hz exactly, it's either 1736 or 1786Hz (perhaps someone with the necessary equipment can see which one they've used?), so some repeaters may baulk at this....

NOTE TO Paulo IK1ZYW... perhaps this topic needs to go in the FAQ? Please say if you'd like me to do this....

.d. G4TUP.

From: yrlesdude
Topic: 2191 Message: 2196

Looks like there's a bit of price competition going on...

If you are looking for quantity buys, the place in NC lowered the unit price to $45 if you buy five. Single unit is still $60.

If you are looking at single unit buys, the place in TX has them for $55 and the place in HI has them between $55 and $60 depending on color.

One may infer the statements from the NC dealer that the UV-X4 or the "Mark II" may be on their way to a US dealer very soon.

My warning came after I had no acknowledgement of an order after 3 email exchanges which supplied a Paypal payment invoice and and transaction ID; there was no sensible response in any reply.

After posting the warning, I finally received an email stating that 409shop had checked the PayPal transaction and that my order had been shipped on 9/12/2011. There still is no record of this transaction or tracking at my member login at 409shop, so I have waited for a delivery.

The order was received yesterday, and the merchandise is fine, so I withdraw the warning - I got what I paid for.

Thanks to this group for the helpful responses!

2198. Memory & FM Stations

Yahoo group: UV-3R (2011)
Date: 2011-09-25 18:23:57 UTC
From: w6qe.milt
Topic: 2198 Message: 2198

New to the Group and the radio.
I'm OK with the radio, what it does and it's limitations. I think it's a good buy.
One question:
I've programmed in some memories, and all is ok with that, EXCEPT, when in the Memory mode and VFO modes, the radio defaults back to a station I have in the FM mode.
I have the VFO set to 146.640. After a few seconds, it switches itself back to 89.9 FM.
Same thing happens when I have a 2m or 70cm ham repeater in memory. It switches itself to FM after a few seconds.
What am I missing? How do I disable that?
Be gentle please?
Experienced replies.
Milt.

Okay, I know what is causing this problem now. The tone decode on this radio is badly implemented.

A popular repeater here in the Los Angeles area, n6hog, asserts 118.8Hz on the output. With rxcode set to this, receive audio and LED blips in and out. Simply setting rxcode to off cures this problem. The issue isn't with the repeater, both my wouxun ht and alinco mobile work reliably with this machine.

Hey Milt.
Press and hold the "L/R" button (orange) for several seconds. Your FM radio is on.
L = Light --- Quick press to turn on and off. (Light still works when HT is powered off)
R = Radio --- Press and hold for several seconds to turn on and off.
This is listed in the manual. Better yet some guys in this group have been putting together a real nice FAQ .pdf document. The FAQ can be found in the file section free to download that should be able to answer all your questions. Hope this helps.

Da you have the "RELAYM" _on_?=

That will blank the pause and the relay-beep for a half second out, after than the RX ist fully activated.

Shipping from HK will need 3-4 weeks to germany as an example.

They send with Hong Kong Post, but the shipping-ID is US-Post, very confusing...

Hey Milt.
That radio function is real nice.
I use it at work. I put it on my favorite repeater and then start the radio.
While the repeater is quiet I listen to my favorite FM radio station and when someone transmits on the repeater the radio is turned off while receiving a signal and a few seconds after. It's a good way to fill dead air and make the day go by while at work.

In http://groups.yahoo.com/group/UV-3R/message/1937 Fran asked how to control if the charger ist working?

I find out:
My issue of the wall-charger has a indicator-LED (german, 230V~).
It lights red when charging and green whent the process is finished.
It lights green also when no unit is connected to the charger!

Caution: At the bottomside of the drop-in holder are two holes, but only one is connected, it's the (left) hole directly under the contacts for the battery (when holding downside up).

Maybee they update the production-process with some new features and better stuff.

> How do you know when the battery is charged when using the drop-in charger?
> There aren't any indicators
>
> --Fran

Hello Fran,

my issue of the wall-charger has a indicator-LED.
It lights red when charging and green when the process is finished (in the radio).
It lights green also when no unit is connected to the charger!

Because of ther's no electronic parts inside, it will overcharge the battery if you let it connected long time.

But I haven'n test the drop-in charger already, I only use the radio, it works also while chargin' ;-)

Caution: At the bottomside of the drop-in holder are two holes, but only one is connected, it's the (left) hole directly under the contacts for the battery (when holding downside up).

See http://groups.yahoo.com/group/UV-3R/message/2136, maybee they update the production-process with some new features and better stuff.

Just thinking out loud...is the cable that you received a USB variety or a serial? I know there have been many posts regarding other brands of radios where owners have difficulty with Windows recognizing or working correctly with USB cables if you are also using a serial to USB adapter. My PC is has serial ports as well as USB and serial is what I use for my Yaesu radios. When I order a cable for the UV-3R I will also order a serial version. There generally is less headache with serial.

2214. Re: [UV-3R] Re: drop-in charger

Yahoo group: UV-3R (2011)
Date: 2011-09-25 23:40:36 UTC
From: The Simpsons
Topic: 1937 Message: 2214

The battery disconnects itself from charging when the built in electronics (in the battery) detect full charge. The wall wart that has the LED in it goes green when there is no load on the wall wart. This happens at full charge or no battery installed. The early wall warts don't have a LED at all.
Many cameras that use this same battery also rely on the batteries own electronics for preventing over charge which can be catastrophic with Lithium type batteries!

Grant, ZL2BK.

> How do you know when the battery is charged when using the drop-in
> charger?
> There aren't any indicators
>
> --Fran

Hello Fran,

my issue of the wall-charger has a indicator-LED.
It lights red when charging and green when the process is finished (in the radio).
It lights green also when no unit is connected to the charger!

Because of ther's no electronic parts inside, it will overcharge the battery if you let it connected long time.

But I haven'n test the drop-in charger already, I only use the radio, it works also while chargin' ;-)

Caution: At the bottomside of the drop-in holder are two holes, but only one is connected, it's the (left) hole directly under the contacts for the battery (when holding downside up).

See http://groups.yahoo.com/group/UV-3R/message/2136, maybee they update the production-process with some new features and better stuff.

THX for this fine information!

I have the charger with me, I have 230V~ in my truck ;-)

But - it could be wise th look out for a spare battery, of course.

I had a faulty Fuji camera in a drawer that had not been looked at for four years. Its battery is a perfect fit in the UV-3R. It also still had enough charge to run the radio for some hours after I tried I found it in the camera. Have charged and used it a few times and it works well with good run time.

Just for completeness, I've ordered a few things from HK and to the UK it's always taken exactly a week from their posting. Normally they pack and post the same day of ordering, but on the occasion of the UV-3R it took a couple of days before they posted, taking the full time up to 10 days..... perhaps they were short on stock! :)

Regards, .d.

It's worth remembering that many USB/Serial 'dongles' do not convert to a true rs232 implementation with some having a '0' level too high for the device attached to read it as a '0'.
None of these cheap ones implement a full +/- 12V RS232 but as I understand it the UV-3R only requires a serial signal of 0/5v swing where '0' is definitely '0'V and '1' is between 3.5 to 5v.
If you have a scope then I suggest you check the serial output of the dongle is actually returning to as near as '0' as makes no difference.
I have gone through many dongles over the years finding some work for some equipment whilst others don't.

I think that UV-3R require UART port with 3.3V TTL level and not tolerance to 5V level. In case that 5V converter used, logical 1 level bigger that processor Vcc. Not sure, but will try to use 3.3V level

Hello.

> Note that the 1842 chip with the 4MHz master oscillator cannot deliver 1750Hz exactly, it's either 1736 or 1786Hz (perhaps someone with the necessary equipment can see which one they've used?), so some repeaters may baulk at this....

It is easy to measure using a computer, a soundcard and any PSK
software: fire up the tone and look on the screen where the peak is. I
believe the softare resolution is enough to measure down to 1 Hz
precision.

> NOTE TO Paulo IK1ZYW... perhaps this topic needs to go in the FAQ? Please say if you'd like me to do this....

Yes, please! I own only one "R" and I am not going to apply all
published mods to it, HI HI.

It doesn't happen on mine. Are you still experiencing this issue? Is
the repeater using an output subtone?
When it occurs, what happens if you don't touch the UV-3R? Does it
resume normal operation after a while?

I see you got no public replies, so it's probably a fault on your "R". :-(

2228. FAQ, version 2011-09-26

Yahoo group: UV-3R (2011)
Date: 2011-09-26 13:15:16 UTC
From: Paolo Cravero
Topic: 2228 Message: 2228

Sirs,
I have uploaded in the files section an updated FAQ document:
<http://groups.yahoo.com/group/UV-3R/files/FAQ/>

I would appreciate if Bill (ve7ikx?), Group Owner, could add a link to
the FAQ in the main Group page and in the welcome.txt file emailed to
all new subscribers.

All others who wish to contribute can do so at the online document editor:
<https://docs.google.com/document/d/1-6qmDIGSLrh6mhhAVpjTrJYO4loQzxQq8fv4AGp9SI0/edit?hl=en_US>
. No registration is required.

Topics that need to be covered are:
- programming from the computer (interfaces available, software,
software tips, ...)
- Mark I vs Mark II comparison

Once again thank you all for your contributions to the UV-3R FAQ
(writers, proof readers, readers).

2233. I've dissected a Nagoya 701.

Yahoo group: UV-3R (2011)
Date: 2011-09-26 14:28:00 UTC
From: andyfoad@rocketmail.com
Topic: 2233 Message: 2233

I've just taken apart a Nagoya 701 that is popular with this group.

I will post some picture later, but here is a brief description.

The centre pin goes to an LC circuit, parallel tuned.

It comprises of a coil, 7 turns, 7mm former and 7mm long with a 3pf disc ceramic capacitor. This looks like a trap, but it's resonant frequency is actually about 190Mhz !

However it seems to form a load in series with a 22cm long element.

I have run an MMANA model analysis on it and it shows a *sharp* resonance at 145Mhz.

On 430Mhz it seems to have a best match between 433 - 435Mhz, then a spike of bad SWR, then looking good at about 438-439Mhz. In the 430-433Mhz region it looks like a poor SWR.

Nothing in this antenna is connected to earth.

So tiger tails (popular with many USA operators) are of no use.

I'll upload some stuff to the files area as soon as a I can.

Regards,

Andy

2234. Re: [UV-3R] Re: Receive LED blinks

From: Darvell Hunt (N7LN)
Topic: 2064 Message: 2234

My local repeater that causes the blinking receive LED and audio cutting out requires no tone code and the receive code on my radio is set to off and I still have the problem.

From: Robert_Chang_Lee <robert.lee@...>
To: UV-3R@yahoogroups.com
Sent: Sunday, September 25, 2011 12:31 PM
Subject: [UV-3R] Re: Receive LED blinks

Okay, I know what is causing this problem now. The tone decode on this radio is badly implemented.

A popular repeater here in the Los Angeles area, n6hog, asserts 118.8Hz on the output. With rxcode set to this, receive audio and LED blips in and out. Simply setting rxcode to off cures this problem. The issue isn't with the repeater, both my wouxun ht and alinco mobile work reliably with this machine.

Did you check the antenna's resonancies before dismantling it e.g. with
a VNA?

I own two of them, but both are a bit out of the band on 2m, in fact on
115 and 128MHz and around 446 MHz on 70cm. So it could be interesting to
bring up their 2m resonancy as I have problems to reach the closest
repeater here.

Hello Bert,

I have 5 more 701's here ;-)))

I can only measure on my MiniVNA 0-180Mhz.

There is in band resonance about 145Mhz ok.

I checked SWR on 433 and 1296Mhz by a simple SWR meter method,
and there was a good match on BOTH bands.

Yes it works very well, even on 1296Mhz as a 3/4 wave.

It it working 3db better than the supplied antenna with my Alinco
G7E on 1296Mhz. So I am very happy.

I suspect maybe the Nagoya 666 is the same antenna, just built
differently ?

Andy

2239. Inside Antennas Photo Album

Yahoo group: UV-3R (2011)
Date: 2011-09-26 17:53:07 UTC
From: Lee - N9LO
Topic: 2239 Message: 2239

I just created an album in the photo section called Inside Antennas to maybe put all the disected antennas in one place to make them easier to find and compare. I added Pic 1, Pic 2, and Pic 3 etc. to my picture names to keep them in order and grouped.

I also added pictures of my opened NA-666 there.

Please feel free to move your pictures of you opened antennas there if you like.

Lee - N9LO

2241. Mark II coming TODAY!

Yahoo group: UV-3R (2011)
Date: 2011-09-26 18:47:39 UTC
From: Darvell Hunt (N7LN)
Topic: 2233 Message: 2241

I just saw on the USPS site using my tracking number where it says my shipment of my Mark II and lots of accessories arrived this morning at my local post office just before 6am. That means it should be delivered today, although the site doesn't say it's out for delivery. (Usually it does say it's out for delivery, although last time when I got my 2 colored UV-3R's, it didn't even say they had arrived at my local PO until AFTER delivery at my house.)

So, if you ordered a Mark II from 409Shop around September 8-9, it's finally arriving to U.S. destinations. (I think shipment was delayed until September 12, as I think they were out of stock when I ordered. And, BTW, I purchased mine from eBay seller jaco3378, an alias for 409Shop.)

Darvell (N7LN)

2245. Got my Mark II, minus my A3SM dual-band antenna

Yahoo group: UV-3R (2011)
Date: 2011-09-27 02:53:53 UTC
From: Darvell Hunt (N7LN)
Topic: 2239 Message: 2245

I was happy to finally get my UV-3R from 409Shop, but they didn't send the A3SM 19cm dual-band antenna, which was supposed to be included with the auction, as I paid more--but nope, no antenna. :-(
I emailed them and they responded within an hour, saying they checked the records and they did indeed somehow miss my antenna. They said they would be sending it now. So, now I wait 3 more weeks to get it, I guess.
Anyway, I also got some other stuff with it, too (which is possibly why they got distracted and missed the antenna). I got 3 extra batteries (I have 3 UV-3R's now), a programming cable, and ear piece, a case (which is cheap and I don't like much) and a bnc-connector converter.
The last item is pretty cool. I also recently bought a bnc-to-SO239-conector so I could connect my triple-band antenna (144/220/440) mounted in the rafters of my house. I was able to hit a few repeaters with the UV-3R that I could not hit with the ducky. So, big success there! That's very cool. I also have a 2m amplifier that should boost my power from my UV-3R to around 12-15 watts. That's pretty sweet.
Anyway, I'm really happy so far with my radio and accessories, but rather disappointed that I didn't get the longer antenna. Oh well. More waiting.
(Also, I have not seen the intermittent receive/blinking receive light problem, but I haven't seen it on my old UV-3R's either. Maybe they fixed the repeater. I'm not sure.)

2246. Re: [UV-3R] Re: 2 wire earpiece

Yahoo group: UV-3R (2011)
Date: 2011-09-27 04:05:59 UTC
From: John Hogenmiller
Topic: 2156 Message: 2246

I would love an adapter over the spk/mic combo. Actually, the MIC looks as big as the radio itself.

Anyways, I ordered a couple 4-pin solder connectors and I'm going to make an adapter. I want to try connecting this to a PC and test doing either APRS or fldigi with it. I think the VOX circuit should be fast enough to handle APRS traffic. If not, I can try building a PTT circuit.

This radio could make a good "modem" to put a laptop on digital mode. It could be a dedicated mobile aprs or packet modem. You can even use the USB port to charge it. The big hold-up here is the 4-pin connector and uncertainty about existing adapters such as the linked Yaesu one.

@makedonce85 - if you get it and it works, let us know. I only have one UV-3R and I already ordered 3 of those 4-pin connectors, so I'm not planning to drop another $13 bucks on that adapter.

The vox is fast enough at the start of transmit (you can always increase the TX delay) but it will leave a dead carrier on the frequency for about a second because the vox delay is not adjustable and that might make you unpopular.

On RX I don't think you can disable the battery saver so you'll miss the start of most packets.

I'm not actually convinced that it's a dual band antenna at all.

It's a 1/4 wave monopole for 70cm used with a handheld.

What else could a simple 19.7cm piece of wire be ? ;-)

Regards,

Andy

2249. Mark II Charger

Yahoo group: UV-3R (2011)
Date: 2011-09-27 12:48:58 UTC
From: Steve
Topic: 2249 Message: 2249

Just received the Mark II yesterday and have noticed the accompanying wall wart charger has a charging light built in. Light glows green when plugged into wall, turns red when radio connected(and assume returns to green when battery is charged). The radio's display remains blank when plugged into charger....however if you turn on the radio while plugged in you can see the battery indicator sequencing indicating charging. Must be a change incorporated with Mark II as a recent Mark I received had no charger led. FWIW

From: Darvell Hunt (N7LN)
Topic: 2249 Message: 2255

I got my Mark II yesterday as well. I'm kind of annoyed that the battery-charge indicator is not present when the unit is off, though it's visible when the unit is turned on.

However, the charge light on the charger is not specific to the Mark II. The blue Mark I that I got a couple of weeks ago also has the LED charge indicator on the power supply as well. I think the red one does too, but I haven't gotten it out of the box yet. I've just been using the one charger so far.

And, but the way, the overcharge circuit in the Mark II DOES function when the unit is turned off. I figured it would, but was mildly concerned that since the indicator was OFF when the unit was OFF, that the charger wouldn't shut off when charging with the unit off. Nothing to worry about there. It works fine, as you would expect.

Here's an update on this using my UV-3R Mark II, which still has this problem, but not as bad. With both radios set to WIDE, the Mark II would only cut out about half as much. That's a good sign, but I'm still not pleased.

I am convinced, however, that's it's a problem with the repeater. I listened for a LONG time last night with both the Mark I and Mark II tuned to the offending repeater with no problem. Maybe about an hour and a half. The green light stayed solid and receive audio didn't cut out.

Then it suddenly began happening again, with the Mark I cutting out more often. After about maybe five or ten minutes of this (sorry, I didn't time it), the Mark II exhibited what sounded like overmodulation for about five seconds. It was kind of a BLAAAAAAHHHT tone over the talker. I don't think I heard this on the Mark I, but it was very brief, so I'm not sure. I was holding the Mark II at the time, so I noticed it on it, but the Mark I was sitting on my desk.

After the brief tone ended, both radios were fine again, and I didn't experience it again.

So, anybody know what might cause that with a repeater?

Subject: [UV-3R] Re: Receive LED blinks

Okay, I know what is causing this problem now. The tone decode on this radio is badly implemented.

A popular repeater here in the Los Angeles area, n6hog, asserts 118.8Hz on the output. With rxcode set to this, receive audio and LED blips in and out. Simply setting rxcode to off cures this problem. The issue isn't with the repeater, both my wouxun ht and alinco mobile work reliably with this machine.

Darvell,

Based on your description and the transitory nature of the interference, I would strongly suspect a paging transmitter is the culprit. Paging transmitters generally run at high power levels (250-500W) and operate sporadically. An intermodulation product where the paging transmitter is one of the signal sources or front end overload from a paging transmitter is a likely cause for what you described, especially in a radio that doesn't have a particularly bullet proof RF front end. The sound you described is also consistent with the sounds heard from a paging transmitter.

LOL
That's a funny humorous reply.
Not sure if that could be done without the smoke signals

:)

If both sides of s simplex QSO use narrow setting when on simplex
you'll both gain a 3db improvement in signal to noise ratio.

Equivalent to both stations running 4 watts each.

Regards,

Andy

use a brick amp...that'll do the trick.
Perhaps there are some 5 or 10W output amps that are small enough to strap onto the back of the baofeng and drive with half a watt...
There isn't enough heatsink to disapate the heat from a higher output than 2W on the UV3R.
Even on half a watt, if you tx for a while on UHF, the radio gets rather hot.

Regards
Colin

I have a 35w to 160w 2-meter amp that I got from my silent-key father that I'm thinking would boost the output from 2-3w to around 9-12w. I haven't tried it, so I'm not sure that actually works, though. I also have a base station 2-meter/70-cm antenna mounted in the rafters of my attic that I could feed it into to give me a pretty good signal from the UV-3R. (I can already hit repeaters with full quieting with the UV-3R with the attic antenna that I can't even key up otherwise.)

This actually sounds like fun. :-)

Uhhh Colin,

only at 0.5W on 70cm??

Thanks for this warning!!!

How about 2W???

So beware of pushing the "F/A" knob as long as required, the TX will send permanent or using the "VOX" function as babyphone...

The TX sends as long as the baby gabbles, fire hazard in advance!!

2274. New UV-3R MK II won't connect

Yahoo group: UV-3R (2011)
Date: 2011-09-27 23:08:14 UTC
From: Francis
Topic: 2274 Message: 2274

Just got a new UV-3R MKII. I got the serial programming cable. I'm using it with a Prolific chipset USB to serial adapter. Radio will not connect at all. It cycles through the comm ports then says "can't connect to the radio. I was using Windows 7 64bit. I then tried it with another Windows XP machine with the same results. I've tried 4 laptops with no joy. I know that something is getting through because the radio backlight comes on after the error comes up. Device manager in all the computers show the correct comm port assigned.

Guess I'm going to have to get the USB cable. Hope it's not the radio.

I got my USB to serial cable from Best Buy . Not sure which chipset that one is but it works ok with that one. It makes a "COM4" port then I just have to set the software to see that port to connect.
I have the USB cable too .

Not sure what else you could try. Sounds like you've exhausted the options.

Prolific chipset USB to serial adapter always gave me problems on all kinds of radios.
When I use the serial cable directly into a serial port then NO PROBLEMS at all.
USB even with the right drivers can be a pain.

Chris,

Look at your driver in Device Manager and make sure that it has properly installed itself. If you see a yellow triangle displayed, it's not fully installed. You may need to get a newer driver from the Prolific website. For whatever reason, I had to install my driver a number of times before it "took"; I'm also on a Win7 64-bit machine.

lol.
seriously though, it does get warm with transmissions of a minute or two, every 2 or 3 minutes.
I get into some long winded conversations on the baofeng because the battery life is so good on the low power setting, and I can hit my favorite repeater with low power.
So, a couple minute long transmission isn't uncommon.

Hi Ron,
Mine works just fine, I was just letting him know an alternative.
I think if you read the email I was replying to, you'll see that it was Francis that was having trouble with his.
I appreciate your help
Yes if you see a yellow triangle it means the driver or the IRQ is wrong
If you see a red icon it means its not working right at all or disabled.

Hello Warning,
I ordered mine from Ebay and it shows the delivery estimate right in the listing below the item as well and the other information. They never sent me any email other than that they received the order and then I ad to watch it with the tracking info that they had sent me. I don't think they are going to be able to respond to every single email but it seems that people are still getting them even without having to get an email from the seller acknowledging the order.

They Do

Have a look at

http://www.aliexpress.com/product-fm/488888465-Baofeng-UV-3R-Speaker-Microphone-good-quality-wholesalers.html

But shipping costs are stupid

Click on Alderney and scroll down to the UK !!!

Yes they do.

Try selecting the option to deliver to the UK instead of Aldernay.

However I suggest you don't bother, because in my experience
anything coming from mainland China (instead of Hong Kong) usually
turns out to be a problem.

The same website also gives you the following delivery options,
ranging from China Post (Free), but with the warning:

"IMPORTANT: China Post Air Mail deliveries might result in delays and lost parcels", unless you pay a minimum of $27.69 for a courier
delivery ;-)

You're better off dealing here:
http://www.409shop.com/409shop_product.php?id=106175

where the speaker mic cost INCLUDING delivery costs only GBP£6!!

Regards,

Andy G0FTD

2288. Mk II Observations

Date: 2011-09-28 13:45:36 UTC
From: Tim W4YN
Topic: 2288 Message: 2288

Received mine yesterday, arrived in 3 weeks so about normmal delivery time.
After playing with it the audio is much better. I do not use software as programming with radio buttons is easy. The second line display is about useless due to not being able to use memory channels. I have not tried this but you maybe able to program a weather alert channel as I believe they us a tone for the alert.

Need to remember that the Mk1 UV3R will suffer low rx audio unless
the 220R resistor is by passed.

Mic should work fine with Mk2, or the UV100/UV200's.

Andy

I'm not certain about the weather alert. The NOAA system in the U.S. uses a 1050Hz tone before the transmission to open up weather receivers and also includes an encoded SAME code (for radios that support it). As far as I know, there is no tone in the transmission that follows the alert tone. The UV-3R can do CTCSS and DCS, but neither of those would work with the NOAA tone.

HI,

I saw the pictures from the D03. How to set another language? I found english and chinese only.

Thank You.

Ran into a little problem trying to program the UV-3R. It connects, everything seems to be fine but then when I initiate a read it does read then I get the little window that says: Read Successfully! Now when I click OK, I get the windows error window: Windows has ecountered a problem and needs to close... Then of corse the program dumps :/

Anyone run into this?

Thanks,

Andy KB8IBS

For Mark I only:
Get a file from the filetab and upload it first time.
After that read will work.

NO. Thath's not true. I have homebrew a speaker/mike starting from an old icom mike. Audio is strong and modulation also. There are some trick to know before homebrew the mike.

First : Yaesu mic doesn't fit because the ring 3 of connector IS NOT connected. Infact PTT and mike are togheter.

Second : Baofeng show on the second ring, starting from ground, the PTT. Ptt goes ON by grounding it with 1 k resistor.

Third : Microphone is DIRECT connected to ring 3, without resistor or condenser. The 3V supply are present into the ring. It is the same on the internal mike.

I recommend to put rf bypass condenser (470 pF) from ground and any wire and, for ptt only, also 1 microhenry impedence. This avoid the continuos TX after ptt push.

The modulation is well deviated but rich of low frequencies due to absence of pre-emphasis circuit. The mike, infact, go direct to IC without any circuit.

Andy,

You might try using the chirp software. I managed to do something to my v.1 file so the software from Baofeng crashes much like you describe. I have no trouble reading or writing the file using chirp. The only limitation is that chirp works on the radio selection (channel) specific settings and none of the other general radio settings.

2300. Re: Programming

Yahoo group: UV-3R (2011)
Date: 2011-09-28 22:40:45 UTC
From: shovelheadjake
Topic: 644 Message: 2300

I had essentially the exact same issue at first.
Tried everything six ways from Sunday.

All I did to rectify the problem was to enter about three or four random frequencies into the program. Wrote those to the UV-3R, and it's been running great since.
No problems now writing to or reading from the radio!
Strange, but it won't work unless you do this first.

Regards,
Jake

2301. Com Port 1 on settings menu dimmed and Com 2 in Device Manager

Yahoo group: UV-3R (2011)

Have DDDD25 on upper and lower display
Downloaded from 409shop v 1.07 software for Mark II and installed.
Downloaded Latest usb driver from 409shop and installed
Rebooted computer
Checked Device Manager. It says COM 2
Ran Boafeng software and checked Setting. Com 1 still selected but dimmed as before
What to do?
Can I re-assign COM 2 to COM 1 on Device Manager as a work around?
How domI do this?

Ok Jake...

Man of the hour :) You Sir were absoultely correct !! In order to make the program read from your little UV-3R without the program crashing, you must first WRITE to it.

When I started the programming software the screen showed one frequency already entered, 409 Mhz or something like that... I simply wrote that to the radio & then did a read and this time the programming software did not crash!

You Sir Get 5 Stars :D

Thanks Again Jake,

Hi Lee. Yes this is absolutely what happens. If I place my UV-3R on a non-metallic surface the received signal strength goes down, so losing the more distant repeaters/QSOs.. If I put my hand around it the signal strength goes up again.

As I mostly use my rig when in the kitchen and cannot hold the unit whilst making those culinary delights, I place the UV-3R on the kitchen sink drainer, which is stainless steel. Voila! The signal strength stays OK. I guess the top of a biscuit tin would be fine for elsewhere around the house. :)

Download the UV3R_MARKII.rar from the files section of this newsgroup.

after installing, read the radio, this puts the software in the correct mode
for your radio

then add some channels and write back to the radio, it should be back to
normal after that.

2313. Re: [UV-3R] Re: MTC version of UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-09-29 15:29:21 UTC
From: Darvell Hunt (N7LN)
Topic: 2156 Message: 2313

Yesterday, I ordered the MTC version of the UV-3R, which I plan to pass onto a new HAM, if he's interested. I think this might be a reasonable alternative to having to use eBay for Hong Kong vendors.

The cost was $55 with free shipping, which includes the MTC UV-3R, a dual-band antenna (not two single-banders) and the headset. Although he has no pictures of his UV-3R online to show the display, I believe it is the Mark I version. Shipping should be much quicker than the 3 weeks I experienced for my last order from Hong Kong. He also has the colors, yellow, red, and blue, as well as the accessories. Plus, from Andy's endorsement below, I'm betting support will be pretty good.

He's also selling these on eBay for a slightly higher price, probably to offset the eBay costs, but you can order them directly from his website at:

http://www.maintradingcompany.com/cart/shop/MTC-Radios-and-Accessories.50?sort=featured&layout=list

He has batteries, programming cables, car chargers, etc., as well. The packaging for the UV-3R's looks a bit different as well.

Even though it's a little more than the eBay Hong Kong vendors (maybe $9 more), I'm planning to direct friends who like my UV-3R to this guy. BTW, I don't know KI5DX personally and have no financial interest in endorsing him. He also generally has some interesting HAM-releated auctions on eBay. Just this week, I purchased two older Yaesu 2m handhelds from him on eBay, which I plan to lend to newly licensed HAMs in my area to get them on the air quickly after passing their test. I'm getting involved in emergency communication preparedness in my local community and am trying to gather "cheap" 2m radios to help HAM noobies get on the air--with instruction of how not to make an idiot of themselves, too, LOL.

Anyway, I'll report on my experience obtaining this radio, including shipping times (it's already been shipped via UPS), etc. I'm probably not going to get it out of the packaging until it finds it's new owner, as I want to pass it along as new, not used, but I expect it to the be the same as my other UV-3R's, but with a different brand name affixed to the front (and one that's easier to pronounce!).

Main Trading Company is Richard Lenoir - KI5DX in Paris, Texas. He is a really great person to work with. If you have a problem with a radio you purchased from him, he will fix you right up. Last week he was selling the UV-3R is 6 packs for $299.00.

There is a trick many people use to add a counterpoise to your HT. you add a 19" flexible wire to the antenna ground lead and let it hang down. I use an old thin shielded earphone cable. solder it to a solder lug that fits over the SMA jack on the radio. see: http://www.hamuniverse.com/htantennamod.html. Mike ad7rz

Two questions I have asked and would recommend every ham ask of resellers is whether they test the radio first, and whether they perform the LPF mod to eliminate the 288 MHz harmonic. Without that mod, the radio does not meet FCC specs. The parts cost is pennies but there is labor involved.

If you import it yourself from China, the changes are your responsibility, but I you buy it from a US reseller, it is their responsibility.

Good point, Leigh. I wonder if most recent version of the UV-3R has dealt with this issue, including the Mark II. I've seen the info for this in the file section at YahooGroups. Interesting how this becomes the responsibility of the reseller.

In any case, the guy who sells this radio at MTC says that as of August 19, 2011, this radio has been FCC type accepted and passes FCC Part 90 and cites a "grant" reference number. I know HAM is through part 97, so I'm not sure if this is sufficient for what you are talking about or not. Do you know more about that?

Thanks a lot Mike for this trick!

But remember, this in an international Yahoo group, most guys here are
not used to handle with old fashioned inches, feet, gallons and so on.
So it would be easier for all of us if you give all values in ISO metric
units.

Yes, that's what I mean. As I mentioned before, this is an
international group, not a native American one.

As your country is one of the very last users of these historical units,
its easier you switch to metric units in international groups rather
than forcing all the other users to convert your national units.

How about each person post in their measurements and

I have to say I was amused when for the US amateur tests I had to calculate dipole lengths in feet or inches when the bandwidth was given in meters. I had hoped that US radio amateurs had scrapped that medieval system and did their antenna calculations in metric units. Oh well, at least we drive on the right side of the road :)

Easy way to fix it is by connecting your radio to your PC and using the programme software, change the frequency range setting from whatever it is set at, this will reboot your handie, after that you can reconfigure it back to the frequency range

you want using the the same procedure. Paul MM6PMC

You also need to make sure you're using the Mark II software. It's version 1.07 (I see from your original message that you're using 1.01). Older software will mess up the Mark II. But, the newer software will also work on the Mark I according to the experience of some users on the forum.

What a poor argumentation!
Because USA hosts some websites and took part at the development of the net, the rest of the world has to deal with your outdated measurement units?

Seems your opinion is as outdated as your crazy units.

Bert

Bert, I worry about you. The gist is that my “poor argumentation” is as poor as I perceive yours to be. You are assuming that there are more “international” members in this group than USA members when you stated “most guys...”. That might be so but again it might not be. Do you have a count of international vs USA members? If you read on you will see that my position is that we can all post they way that we want and those reading it can do with it as they please. I guess you won’t be happy until we all march to your drummer. Now how does that drum beat go...eins, zwei, drei, vier? No, I think it is one, two, three, four on my side of the ocean.

2336. Boafeng uv3-r Mark II

Yahoo group: UV-3R (2011)
Date: 2011-09-29 20:37:40 UTC
From: Jelle
Topic: 2336 Message: 2336

Today I received the two radio"s including the software and cable.

Ordered (date 20 sept) it in at the 409shop and was delivered yesterday.

The software v1.08 is a little bit difficult to use in windows XP, it seems that the radio will only flash if the "voltage" is on the display.

The radio performs (at range) the same as the puxing 888, but the audio is much better. Sometimes it has some interference noise.

You won't understand the principle, will you?

It's not important, what percentage of this group are inch-users and
what are not.
It's a question of cooperation in an international group to use
conventions which every participiant is able to understand and use easily.

BTW: I've neither initiated any drum beat nor do I imprint anybody to
count like I do.

Bert,

Then I say you must learn inches and then we will all understand inches. Isn't that the same as you wanting all of us using ISO metric? Due to the fact that we use inches here it is what we are comfortable with. To use metric would be uncomfortable. You just want us to be uncomfortable rather than you. Again, it is my perspective vs. your perspective therefore the best answer is to continue as we have been doing. I've enjoyed our discussion but think this topic has gone far enough. I welcome your final thought.

guys, guys!
there's 1200 users on this group, and you two think you need to have a petty arguement on list about measurement? Grow up and get on with having fun with the UV3R.
Who cares how a measurement is given, we all know how to convert metric to standard, and standard to metric using calculators, or our good old brains.
It's not rocket science.
Yes, most of the world uses metric, and the US is one of the only countries left who still use imperial/standard measurement terminology...though that has changed and most technical documents or anything to do with science uses metric units even in the US.

Yes, that's what I mean. As I mentioned before, this is an
international group, not a native American one.

As your country is one of the very last users of these historical units,
its easier you switch to metric units in international groups rather
than forcing all the other users to convert your national units.

How about each person post in their measurements and
> the others convert if needed. Lots of easy converters on the internet
> if you need them.

OK, then I will continue in german language, all other users may use one
of the very easy-to-use translators to read my articles.

2343. Re: [UV-3R] Re: Inside Antennas Photo Album

Yahoo group: UV-3R (2011)
Date: 2011-09-29 21:17:14 UTC
From: colin McDonald
Topic: 2239 Message: 2343

in standard/imperial units, you divide 468 by the frequency in MHZ, then divide that number by 2. This gives you a quarter wave length measured in feet, on the given frequency.
For instance:
468/146.000 = 3.205FT.
3.205FT / 2 = 1.602FT.
1.602FT multiplied by 12 = 19.224 inches approximately.
So, 19 and a quarter inches is your electrical quarter wave on 146MHZ.

That's how I was taught, and how I remember it. If you need metric, use a converter. There is a number to do the initial division with, instead of 468, to achieve the centimeters, but I don't recall that number off the top of my head. A google search will yield the result I have no doubt.

I don't own a Mark I, but the dual display isn't that handy if you use preprogrammed channels.

The upper will show the freq, the lower the second frequency in VFO mode. Channel name is not shown and channel name very small.

In full vfo Dual Watch mode, it switches very nice between UHF and VHF mode, where UHF is used if you initiate the transmission, VHF only in reply of VHF reception.

The audio (mic, speaker and sound) is very good (amazing). VHF and UHF range is almost the same as the PX-888, sometimes there is some static in the reception.

I have the Mark II and I find the dual display worthless the way it works now. Maybe they will fix future firmware. I would prefer to just have the single display at this point.

The audio is fixed, but the FM broadcast audio is not.

I also find that when it first receives a station I get a good deeps sound, but after 2 or 3 seconds it turns tinny...I guess its something to do with the DSP..

I like the radio otherwise, its certainly a keeper and happy I bought it.

2350. DDDD25 On Dual Frequency Display of Mark II

Yahoo group: UV-3R (2011)
Date: 2011-09-30 01:11:28 UTC
From: johnoshea1
Topic: 2350 Message: 2350

There is much information in the Group messages on tthis matter. It could use a little order. Here is what I did using the information provided by the Group.

1) If you have preciously installed the software for the UV-3R; delete it from the computer before you start this procedure for the Mark II.

2)Download from the Files Section the Mark II software. I also found this software on the 409shop site. Not sure if both are the same version.

3)Download the driver you require from the 409shop site. I downloaded the usb driver for Windows XP. I did this even though I had the original driver installed. The install will inform you if you have current driver or newer version available for install. In my case I installed tthe newer driver.

4)Plub usb cable nto computer. Go to Device Manager.Click on Ports and determine Comm port assigned to Prolific usb to serial comm. Mine was Comm 6.

5)Run the UV-3R Maark II software from the shortcut on the Desktop. Click on Settings and select an available Comm port. In my case I selected Comm 6 and clicked Ok to close.

6)On the grid at top it indicates Freq Range. The range 136-174/400-470 is presently selected. Click on down arrow to right and another range 144-146/430-440 is shown. Click on this range so it is now slected.

7)At this point my grid filled in the Channel 1 with a rx Freq of 146.0000.

8)My display on the UV-3R had DDDD25 on upper and DDDD25 on lower line at this point. Its been that way for a week looking for a solution!

9)I clicked on Program on top line of grid and selected "Write to Radio". Got a dialogue box. Clicked on Ok and program began writing to radio. Upon completion the DDDD25 disappeared from the first and second lines of the display. My display now shows 146.0000 on first line and 440.0000 on second line.

10)I clicked on Program on top line of grid and selected "Read from Radio". Got dialogue box. Clicked on Ok and program began reading from radio.

11) Success! things are going back to normal! Clicked on Files on top of grid and save As. The Mark II sortware format is *.3R. Original software was *.dat. The original Baofeng Memory Files are still on the computer so I saved this file as UV-3RMarkIIinitialread.3R.

12)Back to the grid and the Freq Range. Click on down arrow and select 136-174/400-470. When I did this Channel 1 was filled in with a frequency of 136.0000.

13)Clicked on Program on top of grid and selected "Write to Radio". Got dialogue box. Clicked on Ok. and program began to write to radio.

14)Upon completion my display showed 136.0000 on first line and 400.0000 on second line.

15)Clicked on Program on top line of grid and selected "Read from Radio". Got dialogue box. Clicked on Ok and program began reading from radio.

16)Clicked on Files on top of grid and save As. The Mark II sortware format is *.3R. Original software was *.dat. The original Baofeng Memory Files are still on the computer so I saved this file as UV-3RMarkIIrevisedread.3R.

This is long detailed dialogue of what i did to resolve the subject problem using the wealth of information provided by the Group members. I hope this dialogue will be useful to any members who have run into this problem. John O'Shea WB1GCQ 09-29-11 Thursday 9:05 pm edt

Metrics is easy. Just divide 300 by the frequency in MHz and you have the wavelength. Want a 1/4 wave? Divide the answer by 4.
On 2 metres then (which is close enough to 150MHz which happens to be 2 metres, hence the name of the band), 300 divide by 146 = 2.0546 metres. Divide that by 2 for half wave or 4 for quarter wave. You could of course divide 150 by the frequency for a half wave or divide 75 by the frequency for a quarter wave. 300 though is easier for most to remember and easy for the brain to get close enough without calculators etc.
Of course if you want smaller units than the metre, then just multiply by 100 for centimetres or 1000 for millimetres. Again very simple in your head.
In New Zealand we converted to metric units around 40 years ago. I was brought up on imperial measurements but find the metric system so much easier.
With use it just becomes natural. Even now though I don’t have a problem visualises what people are talking about when they use imperial measures.

To: UV-3R@yahoogroups.com
Subject: Re: [UV-3R] Re: Inside Antennas Photo Album

in standard/imperial units, you divide 468 by the frequency in MHZ, then divide that number by 2. This gives you a quarter wave length measured in feet, on the given frequency.
For instance:
468/146.000 = 3.205FT.
3.205FT / 2 = 1.602FT.
1.602FT multiplied by 12 = 19.224 inches approximately.
So, 19 and a quarter inches is your electrical quarter wave on 146MHZ.

That's how I was taught, and how I remember it. If you need metric, use a converter. There is a number to do the initial division with, instead of 468, to achieve the centimeters, but I don't recall that number off the top of my head. A google search will yield the result I have no doubt.

Subject: [UV-3R] DDDD25 On Dual Frequency Display of Mark II

There is much information in the Group messages on tthis matter. It could use a little order. Here is what I did using the information provided by the Group.

1) If you have preciously installed the software for the UV-3R; delete it from the computer before you start this procedure for the Mark II.

2)Download from the Files Section the Mark II software. I also found this software on the 409shop site. Not sure if both are the same version.

3)Download the driver you require from the 409shop site. I downloaded the usb driver for Windows XP. I did this even though I had the original driver installed. The install will inform you if you have current driver or newer version available for install. In my case I installed tthe newer driver.

4)Plub usb cable nto computer. Go to Device Manager.Click on Ports and determine Comm port assigned to Prolific usb to serial comm. Mine was Comm 6.

5)Run the UV-3R Maark II software from the shortcut on the Desktop. Click on Settings and select an available Comm port. In my case I selected Comm 6 and clicked Ok to close.

6)On the grid at top it indicates Freq Range. The range 136-174/400-470 is presently selected. Click on down arrow to right and another range 144-146/430-440 is shown. Click on this range so it is now slected.

7)At this point my grid filled in the Channel 1 with a rx Freq of 146.0000.

8)My display on the UV-3R had DDDD25 on upper and DDDD25 on lower line at this point. Its been that way for a week looking for a solution!

9)I clicked on Program on top line of grid and selected "Write to Radio". Got a dialogue box. Clicked on Ok and program began writing to radio. Upon completion the DDDD25 disappeared from the first and second lines of the display. My display now shows 146.0000 on first line and 440.0000 on second line.

10)I clicked on Program on top line of grid and selected "Read from Radio". Got dialogue box. Clicked on Ok and program began reading from radio.

11) Success! things are going back to normal! Clicked on Files on top of grid and save As. The Mark II sortware format is *.3R. Original software was *.dat. The original Baofeng Memory Files are still on the computer so I saved this file as UV-3RMarkIIinitialread.3R.

12)Back to the grid and the Freq Range. Click on down arrow and select 136-174/400-470. When I did this Channel 1 was filled in with a frequency of 136.0000.

13)Clicked on Program on top of grid and selected "Write to Radio". Got dialogue box. Clicked on Ok. and program began to write to radio.

14)Upon completion my display showed 136.0000 on first line and 400.0000 on second line.

15)Clicked on Program on top line of grid and selected "Read from Radio". Got dialogue box. Clicked on Ok and program began reading from radio.

16)Clicked on Files on top of grid and save As. The Mark II sortware format is *.3R. Original software was *.dat. The original Baofeng Memory Files are still on the computer so I saved this file as UV-3RMarkIIrevisedread.3R.

This is long detailed dialogue of what i did to resolve the subject problem using the wealth of information provided by the Group members. I hope this dialogue will be useful to any members who have run into this problem. John O'Shea WB1GCQ 09-29-11 Thursday 9:05 pm edt

Hello group.

I have taken apart another antenna.

It orginally came with my Wouxun, but I see it is being sold as an optional dual band (no name) antenna with many Baofeng sellers.

It's a very simple antenna, just a short inductive loaded monopole.

The pdf is here:

http://groups.yahoo.com/group/UV-3R/files/Wouxun%20dual%20bander%20/

Regards,

Andy

I don't think so.

Copper would decrease the inductance.

So if they didn't need so manyh turn, why wind them ;-)

From: colin McDonald
Topic: 2263 Message: 2372

this only works with the right kind of HT antenna though.
Also, when you hold your HT in your hand, you are offering a counterpoise of sorts anyway, so quite often, this earthwire/tiger tail/counter poise approach doesn't improve your signal at all.
It also kind of bugs me when people try to "improve" their HT's range. First of all, put a decent antenna on it, and second of all, remember, it's an HT...it's going to have limitations.
If you stick a 7 inch antenna onto a radio and try to transmit on 146MHZ, your not going to have the best results.
If you put a 19 inch (quarter wave on 2M) antenna, or, even a 5/8's wave type antenna onto the HT, well, then your going to be maximizing your antenna, and therefore maximizing your performance with what you have.
Yes, the 7 inch ducky will work, but it's not going to work the best.
At minimum, and this is a hard and fast rule for any antenna, you should have at least a quarter wave radiating element. Anything less than that, and you are compromising even if you can achieve resonance and a 50ohm impedance for lowest SWR.
You can make a 7 inch antenna resonate and match to 50Ohms for 20M or 14MHZ if you want as well...but you can make a dummy load do the same thing.
It's all about efficiency and how well the antenna will radiate, not weather it can be electrically made to match up to the frequency and radio.
Also, don't forget, in order to double your signal strength, you must quadruple your power output, or your effective radiated power (ERP).
So say you are talking to someone on simplex with the UV3R set at 2W output, and he is receiving you at 4S units. To achieve a signal of 8S units, which will, at best, be only a little clearer and louder, you must increase your transmitters power to 8W. Or, your ERP must be 8W wich would mean an antenna gain of 4DBI. Pretty much impossible to do for an HT top of the set antenna.
The claims that a 14 inch dual band HT antenna has 3DBI gain is false advertizing at best. Theoretically, perhaps electrically it should, but in reality, it won't.
So, if you want to increase your range, use a higher power radio and a bigger antenna...it works every time.

2373. Possible glitch in Mark II software

Yahoo group: UV-3R (2011)
Date: 2011-10-01 01:13:39 UTC
From: Darvell Hunt (N7LN)
Topic: 2358 Message: 2373

Hey, can somebody with a Mark II try something for me? I've having problems setting the frequency step for 70cm on my new Mark II.

Do this:

1. Get out of memory mode and select UHF on the top, such that the top display shows 44x.xxx. When you roll the knob, the 440x.xxx frequency changes.
2. Now change the frequency step: MENU, roll top knob to STEP, U/V to set STEP, roll knob to set a different value, U/V to store it, then MENU to exit.
3. Repeat step #2 and see if the step was actually changed (or roll the knob to change the frequency).

Mine doesn't change to step to the new value. The only way I can change the step value is to select the value at the bottom display, or VHF/2m mode, then repeat as above, but instead for 2m, then go back to 70cm on the top. Then I have successfully changed the step value for 70cm.

On my original Mark I, the 2m and 70cm modes have different step settings. For example, I can set the 2m step to 10kHz and the 70cm step to 5kHz, and when I swap between bands, it remembers my step for each band. The Mark II always uses the 2m step setting and the 70cm step setting gets thrown away if it's ever changed.

Am I just crazy or has nobody noticed this yet? This is terribly annoying! I want a different step for each band, like the Mark I has.

This is very weird.

2375. MFJ-1714 2m antenna

Yahoo group: UV-3R (2011)
Date: 2011-10-01 02:09:02 UTC
From: Darvell Hunt (N7LN)
Topic: 1937 Message: 2375

I just got my new MFJ-1714 telescoping 2m antenna, which I bought on eBay for $14 (and free shipping). I'm very pleased with its performance. I can hit a repeater with my Mark II that I can't even hear with the standard ducky. It's a little heavy, so I'm worried it might break the antenna mount, but for emergencies when I can't get out, I think it will do very nicely. It's also supposed to perform like a typical ducky when it's not extended. (By the way, it requires a bnc connector to work on the UV-3R.)

Here's the info on the MFJ site:

http://www.mfjenterprises.com/Product.php?productid=MFJ-1714

Yep, I noticed that the UV-3R batteries fit very tight in the radio so I'm using those in my VX-3R and the Yaesu's in the UV-3R. No problem with the off brand charger. Both batteries fit just fine.

From: nr7j
Topic: 2358 Message: 2377

Looks like you have to set the step you need on both bands, if not it stays on the previous steps just like you mentioned.

--- In UV-3R@yahoogroups.com, "Darvell Hunt \(N7LN\)" <n7ln@...> wrote:
>
> Hey, can somebody with a Mark II try something for me? I've having problems setting the frequency step for 70cm on my new Mark II.
>
> Do this:
>
> 1. Get out of memory mode and select UHF on the top, such that the top display shows 44x.xxx. When you roll the knob, the 440x.xxx frequency changes.
> 2. Now change the frequency step: MENU, roll top knob to STEP, U/V to set STEP, roll knob to set a different value, U/V to store it, then MENU to exit.
> 3. Repeat step #2 and see if the step was actually changed (or roll the knob to change the frequency).
>
> Mine doesn't change to step to the new value. The only way I can change the step value is to select the value at the bottom display, or VHF/2m mode, then repeat as above, but instead for 2m, then go back to 70cm on the top. Then I have successfully changed the step value for 70cm.
>
> On my original Mark I, the 2m and 70cm modes have different step settings. For example, I can set the 2m step to 10kHz and the 70cm step to 5kHz, and when I swap between bands, it remembers my step for each band. The Mark II always uses the 2m step setting and the 70cm step setting gets thrown away if it's ever changed.
>
> Am I just crazy or has nobody noticed this yet? This is terribly annoying! I want a different step for each band, like the Mark I has.

Sounds nice.
Try this ultra heavy 2m mono bander

http://www.smileyantenna.com/product_info.php?cPath=21_24&products_id=29

You can choose whichever connector you need.

2380. Hello All

Yahoo group: UV-3R (2011)
Date: 2011-10-01 03:50:47 UTC
From: kb8ibs
Topic: 2380 Message: 2380

Hello All... Name is Andy,

Found some cool accessories for the little UV-3R but first a bit of history...

Started out with radio at the age of 6 or 7, as I remember, with the 100 miliwatt walkie talkies that operated in the 27 Mhz range, I think most of them were CB channel 14. I think you know the ones I'm talking about, with the telescoping antennas that got all bent up & eventually broke off :(Had several sets of them as Birthday & Christmas gifts until one year my parents bought me a Base Station! It was no more than a walkie talkie in a box, lol :) It was a Midland, had a telescoping antenna on the back of the set, a speaker built into the front, a plastic code key on the lower right front and a microphone with a straight cord. The tuning dial tuned across a portion of the CB band and the only other controls were an on-off switch, as I remember. I also seem to remember having to load about 20 D cell batteries into a panel on the back, lol :) Well after calling hello, hello for about 3 days, to my surprise, someone answered! It was a kid I knew from school that lived a couple blocks away, my first contact with someone other than my brother or sister :) We are still friends to this day! I was facinated with radios of any kind and read books and magazines about them in the school library whenever I could. At the age of 12 I noticed an old AM car radio my dad had on the shelf in the garage. He told me I would need a 12 volt power converter, as he put it, to make it work. He looked at me with one eye and said: "Don't try plugging it into the wall". :D

He took me to Allied Radio & bought me a 3 amp 12 volt power supply kit for $6.99 but told me I'd have to save money from my newspaper route to buy the pencil soldering iron & solder, he even loaned me the tools I needed to assemble the kit. I studied the kit & schematic for 2 weeks then bought the iron. The project was a mess but it worked & that's where I learned to burn the crap out of my fingers, I mean solder :) Bored Yet?

After connecting everything up I was only able to receive a couple nearby stations. I showed my dad & he went to the garage and returned with a 12" piece of wire. He stripped the insulation off one end and folded the shiney copper in half and stuck it in the end of the antenna socket. WoW, there were station all over the place! Eventually I strung about 60 feet of wire through the trees in the backyard & through my bedroom window. Can't tell you how many hours I spent DXing the AM broadcast band, slowly dialing up & down the band listening to all the faint stations and collecting & logging their callsigns. I was Hooked !!

Went through the CB craze of the 70's & 80's, started out with a 6 channel pushbutton, crystal controlled mobile with a trunk lip mount antenna. As it evolved I graduated to a 23 channel & then to a 40 channel sideband base station with a Starduster antenna on a chimney mount, how many of you remember those?

Well, then came the D-104 lollipop amplified mic, the peaking, the clipping of the modulation limiters, you know, one of those obnoxious over modulated AM base stations :)

As the interest grew I graduated into the licensed amateur radio community in 1989. Don't get me wrong, I did have an actual CB license issued by the FCC as well :)

When I began my ascent through the amateur ranks there were 5 classes of license at the time. As I worked my way up from Novice, Technician, General, Etc., I kept my original Novice callsign and have never changed it.

I now operate 160 Meters through 900 Mhz & love every minute of it.

Now to make this long story much shorter, I ended up graduating from the University of Michigan with a B.S.E.E. and work as an engineer and project manager. Working as a controls engineer I design circuits for industrial, commercial and residential electric. I'm also a technician, proficient to component level and it all began with a cheap set of Walkie Talkies! Something to think about when your kids are ready for new toys :D

My only regret... I wish my Dad was still here to share it all with, He never got to see what he started :/

73 to all,

Andy KB8IBS

2381. Re: [UV-3R] Experience so far with Mark II

Yahoo group: UV-3R (2011)
Date: 2011-10-01 05:23:39 UTC
From: Bill Maxwell
Topic: 2138 Message: 2381

My new Mk2s arrived a few days ago but I have only now had time to play with them.

I have come across one additional change with the MK2 over the earlier MK1 that I don't recall having seen reported previously, although I may have missed it.

The MK2 seems to have a reduced frequency range, although it may just be a difference in the programing software. With the Mk1 software, you had a choice of six ranges from which you could select one, including the V+UHF1 selection that a few of us MK1 owners missed and struck problems getting the radio to program on both bands. The others options are seemingly all single bands but include a 350-390 and a 450-520Mhz selection.

With the new UV3R2 software that selection has been reduced to just 2; a 136-174/400-470 choice or a 144-146/430-440MHz choice. Gone are the 350-390 coverage and the 470-520MHz coverage.

It may be that those frequency ranges are still accessible on the MK2 through using the original programing software but others have reported problems trying to program the MK2 with the older software, so I haven't tried. Alternatively, there may have been firmware or hardware changes with the MK2 that really do prevent its use above 470MHz.

I guess it is also possible that while its programing software might allow the user to key in a frequency say in the 470-520 range, the MK1 itself may have rejected anything above 470 MHz, or anything in the 350-390 range. I have not tried that as I did not have a programing cable until one arrived the other day with the MK2s. I might experiment with the MK1 a bit later tonight.

Assuming the range of the MK2 is as suggested by the new software's selections, do the different coverage choices matter?

That probably depends upon your intended use and country of residence. My own needs will be met by the new MK2 but I imagine some users of UHF CB here in Australia are going to be disappointed that they cannot get the MK2 to program up beyond 470MHz.

Bill

>
> Right out of the box I had it working on a local UHF repeater. I like the new dual-band antenna as it is not only functional but fits the overall look-and-feel of the radio (I scrounged up an old dual-band antenna for my original UV-3R, which while functional looks like crap).
>
> I also like the fact that the two-line display allows for displaying the menu name and the value you're editing.
>
> I just finished programming it with the software, and it went smoothly without any hitches. I used a USB cable from 409Shop along with the USB drivers and the latest Mark II programming software (UV-3R v1.08) from the 409Shop website. The system I used is running Windows 7 Professional 64-bit. After installing the driver and software I inserted the cable and it was immediately recognized and assigned to COM3. I started the software, set it to COM3, and read the radio to save off an initial file (just in case of later problems).
>
> One small quirk I observed is that when you tell the software to read or write from the radio it will display a small dialog box with a progress indicator. You must press 'OK' before it will actually start communicating with the radio (if you don't realize this you may think that it's stuck and can't connect to the radio).
>
> The other quirk with the software is that for some reason Windows 7 is showing the UV-3R uninstaller in the 'Start' menu. To actually run the program you have to expand "All Programs," then the "UV3R" program group to access the program.

Yeah, I saw that one, too--after I ordered the 1714. I didn't get the antenna from MFJ, tho. I got it from eBay for cheaper than the MFJ list price and with free shipping, too (the same guy has more). I didn't even know what radio I planned to use it on, but it looked pretty cool for $14. With the bnc connector, I can use it on more than just my mini-HT's. And, with a full half wave, it seems to have great performance.

yes, a full half wave on UHF perhaps, but definitely not on VHF.
In fact, it's more than a half wave on UHF, it's more like a 5/8's wave on UHF...but it's well short of even a quarter wave radiator on VHF.
Perhaps it's electrically a half wave with the coil and matching network at the bottom inside the little conical shaped piece around and just above the connecter.

The less obvious benefit of using a BNC adapter is that BNC is a more robust connector if you frequently change antennas. SMA connectors tend to become unreliable with age because the center pin of the antenna turns in the socket causing wear.

Could you turn your word wrap on so the need to have to scroll forever to read your sentences isn't necessary? You could put the messages into a paragraph and then post them here.

Do you know if there is any hardware or software mod to make the radio receive on 400 to 500 MHz?

Subject: [UV-3R] Re: MFJ-1714 2m antenna

The less obvious benefit of using a BNC adapter is that BNC is a more robust connector if you frequently change antennas. SMA connectors tend to become unreliable with age because the center pin of the antenna turns in the socket causing wear.

> you should have perhaps bought the 1715S, same thing, but really thin, and doesn't telescope, and has an SMA connecter instead of a BNC.
> I took the UV3r apart the other day to modify the pin hole in front of the microphone for better pass through audio...and found that the SMA connecter is very well mounted right into the main heat sink of the radio.
> Better design in fact than either my kenwood TH F6A or my icom ICt90a as far as strength goes. So don't worry too much about snapping the SMA off or damaging it too much...although, with an SMA M to BNC F adapter, then the BNC connecter on the antenna, you are much more likely to cause allot of leverage on that poor little connecter.

2388. Best Baofeng "dx" ?

Yes you bought the wrong battery. There are 2 types of NP-60 series batteries. The Baofeng UV-3R uses a standard NP-60 type, there is another NP-60 CA series that is much smaller and has a small "tab" on the top corner. This series is used in Casio products and isn't close to fitting the UV-3R. And yes I am speaking from personal experience. good thing they aren't expensive ;-) Russ

Yep, I noticed that the UV-3R batteries fit very tight in the radio so I'm using those in my VX-3R and the Yaesu's in the UV-3R. No problem with the off brand charger. Both batteries fit just fine.

2394. BNC to SMA adapter

Yahoo group: UV-3R (2011)
Date: 2011-10-01 17:29:49 UTC
From: W3FIS
Topic: 2394 Message: 2394

Got one of the BNC female to SMA adapters -- sold as an adapter for the "Kenwood" to try on the Baofeng.

Very slight interference with the LED. Quick cut with an Exacto knife -- maybe 1/32" at most, to clear a small space, and the adapter now seats well. I can now use my fairly extensive collection of BNC whips, and quickly connect to my base station J pole.

RG-58 cable is stiff enough to still put a strain on the Baofent, so the SMA to SO-236 or BNC "pigtail" adapter is likely still the better bet for the J pole connection.

Got it from one of the suppliers in Hong Kong in about 2 weeks. Airmail, and all sorts of pretty stamps!

2397. Got my MTC UV-3R in just 3 days

Yahoo group: UV-3R (2011)
Date: 2011-10-01 19:37:38 UTC
From: Darvell Hunt (N7LN)
Topic: 2395 Message: 2397

Today, I got my new MTC UV-3R from Texas, just 3 days after ordering. Wow, that's better than 3 weeks from Hong Kong!

What's in the package is a little different from what I got from 409shop. The dual-band antenna is even longer than the one I got on my Mark II, at about 18cm. I'm surprised at that! I verified that it is the Mark I, not the Mark II. It also came with a speaker-mic headset and the box was much different from my Hong Kong versions. And, I got shipping to my door in 3 days for $55 total. Not bad!

Other than saying "MTC" instead of "BAOFENG", it looks identical to my other ones.

I haven't verified if it has a harmonic problem or not, but I'll check into that.

Darvell (N7LN)

Cliff,
Looking at the picture of the Casio NP-60 battery you bought it is not the same as a Toshiba or Fuji NP-60 which is the one you need for the UV-3R. Just to confuse matters even more Casio (or the online dealers) appear to number these as an NP-30.

From: DavidN
Topic: 2398 Message: 2402

When the earphone is plugged in there's a 220r resistor (R30) between the earphone and the return to earth. It seems to shape the audio slightly, only when the earpiece is plugged in. Bridging this resistor may bring the level up slightly.

As you may have read, normal users listening to the loudspeaker prefer to reduce the volume instead of increase it.... so you would have to do the opposite of what everyone else usually does i.e. increase R15 from 100k to 330k, and bridge R13 from 10k to 0k.

Then you would have extremely loud loudspeaker audio but perhaps audio that's loud enough on an earphone in a loud environment. Note that the LM4890 audio PA chip can only put out 500mw with 3.7v on it, so you may get some distortion (1w with 5v on it).

The alternative, and probably the easiest option in the end, is to retrofit an external audio booster amp between the earphone socket of the rig and the earphone.....

.d. G4TUP.

The battery that came with my UV3R didn't fit itself.
I contacted them and wound up pushing it hard and it fit.
The ebay ones I got an the Yaesu ones fit better.
I go some 1400mah ones for $4.97 on closeout at Radio Shack and while they work they seem to have even less capacity that 1400mah, perhaps because they are old.

I can't wait to see what I get from Deal Extreme....the brand on their UV-3R is "Magiksun." Why did I order from these guys? The price was right, I didn't have to use a credit card....and part of buying something like this is just the "SURPRISE!" factor when you open the box.....

Yes they did! I purchased something earlier in the week from MTC and it was shipped via UPS, apparently because it was heavier. I still haven't gotten the item I purchased first, but the radio was QUICK.

It's set to 5K. Very strange, any help would be appreciated. I can put 154.900 in and it is fine. I can put 154.880 in and it holds, but I put 154.890 and it jumps to 154.8899? I can't figure it out and I have looked over the settings.

HELP!!!

I have found a similar situation in entering transmit frequencies for some repeater pairs. Typically the receive frequency enters ok, for example 147.0000 goes in but the transmit frequency enters as 146.4001, even though my typed entry clearly showed as 146.4000 before I moved the cursor from that field.

Here's something to think about when using your charger during use: on my new Mark II, when I have the power plug in the side from the wall charger, I cannot transmit. I'm wondering if that's by design, or if there is something wrong with my UV-3R. I haven't checked this with a Mark I yet, but it seems very strange to me. I wonder if the power from the charger can overload the transmitter, so the designers disabled that? I dunno.

Can somebody else confirm this is how the UV-3R works?

This is a round off error in the computer. Computer can't understand numbers with decimals, so they use integer numbers to approximate floating point numbers. If not enough precision is used in the program, the numbers seen can be slightly off like this. There ARE things you can do, as a programmer, to minimize these problem, although the issue cannot be solved completely. Apparently, not enough attention was given to this issue when designing the program. (I'm assuming it on the computer frequency programming side and not the radio side, but it's hard to tell from the descriptions I've seen.)

Yes, I'm a computer programmer by profession and have seen this issue sometimes in my own code. You can write work-around code to help avoid it, but it cannot be completely solved. But if you are seeing this issue (and obviously you are!), some programmer didn't finish his job.

So, as a user, you may be able to enter a different frequency to get what you want. I don't have the programming software installed yet, but you may be able to type something like 146.9999 to get 146.4000. This way, you are counting upon the round-off error to get the end result that you want. I don't know if that will work in this situation, but it's work a try.

Hello to the group,

I have the same problem with my UV-3R Mark II as described above. A reset does not help at all. Is there any solution for this problem? Would it be possible to get a original read out file and try to upload it? I still can read (and most propably write) with chirp. Where to get an original file, I was an idiot and forgot to read out first and to save it....

Any help or solution will be much appreciated...

From: DavidN
Topic: 1984 Message: 2432

Hi Fred. Yes, operators have experienced this a number of times. It's been written up in the very latest FAQ, soon to be published...

The answer is:

This happens when a UV-3R Mark II is programmed with an old version of the programming software. Download the newest software version and try re-programming your UV-3R: it should return to normal operation.

The FAQ does go into it more, but have a look in the files section for the latest programming software - it works with both Mk.II and Mk.I rigs OK.

Thanks a lot David, this is interesting. What is the latest version which works both rigs and where to find it? I have here 1.0.7...

Hi Fred. I'm not sure as I don't use it, but it's dated Sept.24th. It's available here (look for *UV3R_MARKII.RAR*):

http://groups.yahoo.com/group/UV-3R/files/Software/

Thanks a lot. I've found the 1.0.8 on the internet meanwhile and it solved the problem. First it didn't connect to the rig, after setting the USBserial COM port to 1200 baud it worked fine. After just setting memory channnel 1 with useful entries and uploading it the radio it was back to normal. Puhhhh....

That is light weight enough to be useful. I've used my Baofeng with an Arrow on a tripod with good luck, but the Arrow is more weight/torque than I wanted to hand hold.

Let us know how it works out. How did you couple the recorder into the radio??

/paul W3FIS

2440. Re: UV-3R leo AMSAT station

I've not coupled the radio to the recorder(that's a thought though). I just use it to capture my side of the qso to be sure I've recorded calls etc correctly. Easier for me than trying to handle ht and antenna and use a pencil as well..... ;-)

2442. UV-3R battery discharge problem.

Yahoo group: UV-3R (2011)
Date: 2011-10-03 20:48:55 UTC
From: Dave
Topic: 2442 Message: 2442

Has anyone else seen this problem...

I have two radios and 3 batteries...so I can rule out some of the hardware.

Problem is one of my radios seem to discharge the battery even when the radio is turned off.

Tonight I charged the battery (4.2v on switch on) within a couple of hrs its down to 3.8v. I left the radio off the other night, and in the morning the radio wouldn't even turn on.

I did try an measure the current drain with the radio off, but as yet havent mastered the meter / battery and button combinations needed but this is only going to confirm the radio is using some significant current while turned off.

Tonight I completed a factory reset, but I suspect that's not made any difference.

One theory is that "little fingers" decided to plug something other than the factory standard charger into the radio (maybe a phone charger) and this has caused some damage to the integrated charger circuit....but one may never know...

Due to the price its not a major issue, I may well just order another...

Any thoughts...

Topic: 2409 Message: 2446

Some HTs produce buzzing on the signal when you transmit when having the charger plugged in because it is picking up noise from the power supply so when you transmit you are covered in buzzing or 60 cycle hum. Could be by design and they didn't want people transmitting using the charger plugged in. Depends how they wired it. If it powers the radio without the battery in it and the charger on can give 500ma then it wouldn't be much use to try to tax the charger with 1.5A transmit current
If it is wired to charge and also power using the charger inside the radio then it would still work. I would maybe look at an external power source or supply and make a cable that works on the UV-3R instead of using the charger to power it for transmitting.
Just a thought on that one.

2449. Cool Accessories

Yahoo group: UV-3R (2011)
Date: 2011-10-03 22:06:28 UTC
From: Andy
Topic: 2449 Message: 2449

Ok, finished the pics so here's the new photo album I uploaded...

http://groups.yahoo.com/group/UV-3R/photos/album/1156233333/pic/list
<http://groups.yahoo.com/group/UV-3R/photos/album/1156233333/pic/list>

Description:

Pic 1: Photo of the UV-3R with the factory VHF antenna installed

Pic 2: Factory Charger & Base

Pic 3: Adapters that I feel necessary. On top is a dual male barrel connector for use with the mobile dual band magnetic antenna I bought for my Wouxun dual bander since the SMA connectors ore the opposite on the 2 HT's. In the middle is the male SMA to so-239 for use with any antenna with a PL-259 plug. On the bottom is a male SMA to female BNC, I made a pigtail with RG-174, on one end is a male BNC and the other is an SO-239. Makes it easier to use on my base antennas that are all RG-8 size. The adapters were all $3 or less each.

Pic 4: This is the part number for those interested in the pouch. The Pouch is available at Home Depot for $6

Pic 5: This is my factory battery and a couple NP-60 spares. The spares were $7 delivered for 2 of them which beats the $9 price tag for a factory one

Pic 6: Here's the pouch I found. Can't believe it's not made just for the UV-3R. It holds all the accessories in pic 12, including the radio, and there's an elastic slot on each side of the pouch to hold the factory VHF & UHF antennas

Pic 7: Here's the UV-3R with the Nagoya 666 dual band antenna. I chose this one over the 702 because it is more size appropriate for the little rig at 9" and you can sit down with the rig on your belt without destroying the antenna, it's extremely flexible

Pic 8: This shows the back of the pouch with the belt clip

Pic 9: This is the mobile charger setup. I opted for this so I can also use the cable alone to charge the rig with any USB port, like on my laptop. Cost was about $9 delivered

Pic 10: The AA battery case so I can use store bought or rechargables. I did spend the extra money for the Yaesu (Standard Vertex) case for the Yaesu VX-3R so I could use the slightly larger rechargables. If you look closely you will see the notch I had to file on the back of the case to clear the UV-3R belt clip mount. With 2500 ma batteries I got

close to 16 hours of use, WoW!

Pic 11: Another shot of the mobile cigarette lighter USB charger

Pic 12: Here's a pic of all the accessories that fit in the pouch including the UV-3R itself. The only thing not shown are the factory VHF & UHF antennas but they again store on the outside of the pouch, one on each side.

Pic 13: These obviously are the factory VHF & UHF antennas

Pic 14: The factory Earpiece/Mic

Pic 15: I did spend the extra $8 for the leather case. It's a glove fit and made just for the little UV-3R, much nicer than the softcase

My UV-3R is the 18 menu version with DSP, it came with the 2 separate VHF & UHF antennas. I also purchased the programming cable and software package but I don't store it in the pouch.

The only complaint I have is the skipping on receive but I'm pretty sure it's the DSP circuitry not dealing very well with strong signals that tend to overload the front end, it only happens when very close to a repeater.

The only planned Mods are the volume mod because it's way too loud in the evening when everyone else goes to bed. I'll also do the LPF mod to get the second harmonic down and be a bit more compliant and I will swap out the display LED's with blue ones, I don't hate the Red display, I just like the Blue better :)

I've put the little rig through its paces over the lasr few weeks and so far I am impressed... Great for carry in the vehicle anywhere you go...

Best 73,

Andy KB8IBS

Thanks John, I had downloaded the uv3r software file and had hoped to
pre-load the freqs., then when I got the radio just download it then. It
appears that I can't do this. Not to computer knowledgeable with the dat files.
I assume that once I get the disc with the radio, USB cable is included
in my order, then I have to do it all at one sitting?
Had hoped to "save file as" then just kick it into the radio once I had my
100 freqs. figured out.

Yes you can do that. When you get the radio and the USB or serial lead has been attached and the drivers installed, the program can be started, the correct COM port assigned, the saved file loaded and using the Device/Write option it can be written to the radio. Job done.

Good luck

John, you can create your frequency file now before receiving the radio. I suggest once the radio is received you connect, confirm matching com ports then read from the radio confirming communications. Once done you can then load the previously created frequency programed file and your ready to go.

Thanks for that explanation, Darvell. I'll try you suggestion a bit
later, although I doubt that the error will make any practical
difference to normal operation of the radio.

Yes you can do that. When you get the radio and the USB or serial lead
has been attached and the drivers installed, the program can be started, the
correct COM port assigned, the saved file loaded and using the Device/Write
option it can be written to the radio. Job done.

Good luck

From: Bill
Topic: 53 Message: 2455

Sorry for digging up an old topic, but thought I would share some findings.

I received a speaker mic today ordered for the MKII. As I still have a MKI in-stock I decided to try it out and see just how low the audio was. To my surprise it worked flawlessly. Keys up the radio, and the audio coming out is just as loud, or as soft, as I have the dial set to. Possibly the later MK1's have the low audio out resolved?

2458. Re: USB charger

Yahoo group: UV-3R (2011)
Date: 2011-10-04 03:02:36 UTC
From: mjlindsay49
Topic: 2409 Message: 2458

One of the problems I have seen with this radio is that it is highly sensitive, and the squelch range is not very great. As a result, even with the squelch set to 9 (max), it is still vulnerable to local RFI.

Another issue you may not be aware of is that chargers usually do not have much current output, so if the radio is connected to a charger, you are not very likely to be able to transmit without the radio either not transmitting, shutting down, or resetting. Mike AD7RZ

Dave.

The radio does slowly discharge the battery even when switched off as the on/off control is electronic and not a mechanical switch of the old school so needs a constant power connection to function.
I'd suggest that the problem is with the battery which is not taking a full charge (despite showing 4.2V on switch on) and is consequently probably self discharging as well.

Can I just repeat something I put in the FAQ, which may be read more here than in the FAQ :) about Li-Ion batteries. They don't like being fully discharged - you should re-charge them before they get down to about a third i.e. one little bar left in the battery symbol. Also, they don't like being left fully charged in a hot environment....

Have a look at Battery University for more info - there's a neat list there showing the amount of discharge and how it affects how many times you can recharge.... And the effect of temperature....

2464. radio will not turn off

Yahoo group: UV-3R (2011)
Date: 2011-10-04 11:44:03 UTC
From: Andreas Papagapiou
Topic: 2464 Message: 2464

Hi everyone!

I received my UV-3R yesterday. I charged the battery and as soon as I installed it in the radio it turned on.
Everything seems to be working fine, except that it will not power off!
I tried pressing the ON/OFF button for 1 or more seconds, but it still won't power off.

The only way to turn it off is to remove the battery.

Has anyone experienced a similar problem??

cheers,

Andreas

Andreas,

> I received my UV-3R yesterday. I charged the battery and as soon as I installed it in the radio it turned on.

this is normal, it happens with all UV-3Rs. Maybe someone can confirm
it happens on MarkII too.

> Everything seems to be working fine, except that it will not power off!
> I tried pressing the ON/OFF button for 1 or more seconds, but it still won't power off.

Just wondering: do other buttons nearby work? Like V/U, MENU and VOL?

The positive side of your fault, if it is a fault, is that the on/off
button mechanics are very easy to access.

2466. UV-3R MarkII harmonic suppression

Yahoo group: UV-3R (2011)
Date: 2011-10-04 13:02:08 UTC
From: dk1bn@amsat.org
Topic: 2466 Message: 2466

Here we modified (LPF) about 10 pcs of the old version of the UV-3R. After modification we got about 42-48db suppression of the 288MHz harmonic inside the european 2m VHF band (144-146MHz). In the original version we had only about 22db supression. The new (MarkII) version I received here was even worse and we measured about 18db (original) and about 39db with the LPF mod. LPF seems to be ok at 160MHz without modification. All measurement done in the "Power High" position.
Using the low power position you will always get more power on the first harmonic than on the user frequency.
70cm band was ok on both models.

I will never understand why this nice little thing got a FCC or CE certificate. My hint never use it without modification on the VHF amateur frequencies and never on low power position.

Hi Paolo,

Yes, other buttons work. The on/off button is the only one
that doesn't work as expected.
I'm wondering whether I should return the radio for replacement or try to fix it myself...

thanks and 73,

Andreas - 5B8AP

I accepted the risk and fixed mine that did not receive on VHF: it was a cold solder joint (it's in the FAQ too). Depending upon where you bought yours, you might end up without the transceiver for another couple of months. It all depends on your needs. And, by the way, the replacement might be faulty as well...

I suggest that you study pictures of the UV-3R in the Photos area of the Yahoo Group. Some are detailed enough so that you can guess where the fault could be. You can reach the on/off button by unscrewing just two screws, and the front plastic panel comes off easily. There is a video on youtube that shows the process, up to the point that you need to unsolder the antenna connector to get to the other side of the PCB (where my fault was located): hopefully you don't need to go any further.

Just remember that you void the warranty.

Please keep us updated on your choices and achievements!

Yes, I am using a Puxing PX2R speaker microphone and a Nokia AD 53 adapter (from 3,5 mm to 2,5 mm 4 pole)and it works very good.
But it does not work with EQSO as my Puxing it does, because the Baofeng needs some PTT to microphone bias resistor, I guess.

Why is it that folks assume that just because a charger only puts out a very small amount of power that that a battery operated radio won't work?

It does not matter what the charger puts out, if the battery has enough charge to run the radio normally then adding the charger power only supplements charging the battery and not is not necessarily essential to run the radio in RX or TX. The power required to TX comes from the battery.

Easy experiment... Charge the radio up, leave the charge plug in the radio and unplug the charger power supply from the wall/USB source....
Hummm still working like normal with the charger plugged into the radio and supplying 0 power.

Of course if the battery is dead or not even in the radio then the UV-3R charger most likely won't have enough power to operate the radio normally during RX, let alone TX.

From: W3FIS
Topic: 2474 Message: 2474

The Baofeng, of course, can be programmed for public service channels. However, I surely don't want to transmit on them! Ditto for the NOAA weather frequencies.

Other than making the transmit frequency something in one of the ham bands, "out of the way," is there another way to address this problem?

2475. 409shop in Hong Kong is very busy

Date: 2011-10-04 15:39:33 UTC
From: Darvell Hunt (N7LN)
Topic: 2409 Message: 2475

Just FYI, 409shop from eBay in Hong Kong is very slow right now. The past two orders from them look quite a number of days to get shipped after purchase. I ordered some accessories (not a radio) on September 30 and they finally got shipped today, which is about a five-day delay. My last order, a Mark II, took 4 days before it got shipped. A couple of weeks earlier, my two UV-3R's got shipped rather quickly.

I also have still not gotten the 19cm dual-band antenna they accidentally left out of my Mark II package and I don't even have a tracking number for it, either, although they said they were shipping it.

So, add a few extra days to the normal schedule if you plan to order from them.

Topic: 2474 Message: 2476

I have found the most effective way to avoid problems with this, is not to push the PTT button unless it is on an Amateur frequency. ;)

Subject: [UV-3R] Monitoring Public Service frequencies

The Baofeng, of course, can be programmed for public service channels. However, I surely don't want to transmit on them! Ditto for the NOAA weather frequencies.

Other than making the transmit frequency something in one of the ham bands, "out of the way," is there another way to address this problem?

Since the weather channels are always transmitting, you can prevent the UV-3R from accidentally transmitting on those channels by setting Menu 18, BCLO (Busy Channel Lock Out), to ON. This prevents the radio from transmitting when a signal is received. I am not familiar with the public service channels, but if they also constantly transmit, setting BCLO to ON will work there too.

October 1st is a national holiday for them. Depending on when workers take time off will have something to do with the delays. DealExtreme, another shop I order from, stated they would be closed for the entire week. I believe 409 ss just closed for the one day, however if their suppliers are closed that will add to delays in them getting stock.

If you are programming using a computer, leave transmit blank. Not sure how you would do this if manually programming the radio.

Thanks Slim, yes this could be the case but as I say I have two radios and 3 batteries. The other radio can stay switched off for days, and still power up and works just fine.

The other radio will go from full to empty in one evening...

I will try some elimination, it could be the battery is poor...hopefully that's the cause...

I think the best way to prevent accidentally transmitting on the public service freqs is to actually punch in a ham frequency for tx.
Unfortunately these radios are not like others such as the wouxun where you can set the thing to only tx in the ham bands via the software.
Anyway, you can also just not put in the tx tone for the public service freq, that way if you do key it, no one will hear it. Set the power to low as well in the programming software, or just put 0 in the tx field...the radio will probably beep and give you a message on the screen when nothing is programmed for tx.
The baofeng does not have tx inhibit like most ham rigs seem to.

I also like the other advice, just don't press the PTT button lol...

Regards
Colin

From: jschoap
Topic: 2482 Message: 2482

Hi all,
I ordered one of the above antennas from HK. It's super flexible, doesn't "unbalance" the HT in the sense that it's not overly large and it seems to perform well. I could make it into a local repeater with the stock mono band antenna but my signal reports have improved since using the Nagoya. Not bad for less than $13.00 including shipping! Has anyone else tried this antenna?

Yes of course, the FAQ is excellent and one of the best I have read for sometime...thanks for pulling this together.

I suspect the issue I have is not relate to a battery, and more hardware related. Ta Dave M0TAZ

I have used it since June (bought for $10 on ebay including shipping) and I am very happy with it. It survived the summer including a week-long road trip to Disney and a weekend to New England.

I see pics posted of the antenna's insides...

Come on, folks. Does it really matter that there appears to be just a length of steel cable with no matching network found inside? It performs better than the stock single band antenna (with a loading coil). A screen pic of this antenna through an analyzer shows a clear dip at 148MHz.

This should be called genius, but folks slam it as some sort of fraud instead.

Any deviation from an ideal antenna is a compromise, get over it.

I agree... It Works! Mine shows a definate improvement over the stock VHF and UHF antennas. Later in life we'll learn the affects of being a capacitive coupling system for an RF transmitter, LoL :D

If you like the 666 take a look at the Nagoya NA-401. A bit beefier but about the same size...

Yes, it's a very good choice for the reasons you mention. It's about 1dB down compared to the NA-701 on 145MHz, but the 701 is a bit longer and looks a bit top heavy on such a small radio.

Avoid the 401. I have one here which I got because it is slim and looks an ideal match for the UV-3R. But the SWR dip is quite a way off 145MHz resulting in a poor SWR costing you 3 or 4dB compared to the 701. It is too high in frequency, hence too short so I couldn't try bringing it to resonance by shortening it.

2493. UV-3R Driver not found

Yahoo group: UV-3R (2011)
Date: 2011-10-05 12:26:04 UTC
From: fourzan
Topic: 2493 Message: 2493

I just received my UV-3R in the mail yesterday with the USB programming cable.

After installing the software and the driver for programming, and plugging in the the USB cable in, it tells me it needs to install the driver. I came to this site, downloaded the driver from here, and same thing. It can't find it. I have entered all my frequencies in the program and want to transfer everything to the radio, but no go.

I looked at the Control Panel device manager, and I don't see anything that resembles the name of the driver or the radio. I have Windows Vista, by the way.

The driver is an auto-install driver (*.exe) so it doesn't matter how many times I try to install it, I don't know what file to look for in the Windows folders to see if it installed.

Any help, please?

Richard, KR4ZAN

Well...

I read the thread below and tried to do the same.
I opened up the radio and scraped the surface of the on/off button
with a knife.
Unfortunately, the problem persists.
I even tried shorting the two ...circles of the button to see if the radio would turn off,
but it did not make any difference.

Any other ideas?
Now that I opened it up, I have to fix it :-)

I would trace where those pads go and see if there's a broken trace, or cold solder joint. Study the schematic and see what it connects to. Does it ground or provide positive voltage somewhere? Try doing what the button is suppose to right at the component it is suppose to do it at. If that makes sense. Try not to short out positive and negative of the battery.

I ordered my UV-3R Mk II on September 23rd from 409, and it was delivered yesterday. Perhaps a little faster than I thought it would be, and I'm pleased with the radio and the shipping time.

Yep, don't push PTT! <grin>

I will see if I can just program a receive frequency. Worst case, put in a "empty" ham frequency.

Thanks!

Hi Richard,

I have several tips on my website here. http://www.fleetwooddp.com/radiohelp

Sounds like you may have a corrupted driver install, there is a remedy for that on the help page.

Thanks / 73s
Bill

Thats pretty good timing. Did it actually leave hong kong the very day you ordered it? If not, then the shipping time might not have been 12 days after all. Maybe only 9 or 10.

2501. Re: Mark II Programing Help

Yahoo group: UV-3R (2011)
Date: 2011-10-06 00:32:14 UTC
From: deputyjoel
Topic: 2411 Message: 2501

Thanks for the reply and explanation. This is a significant issue in my opinion. Even though it is slight, I want to be broadcasting on frequency. I have found this to be a problem programming several frequencies with the Mark II 1.7 version software. Not happy with the new software. Perhaps there will be a fix with a new version, otherwise, I'm not using it.

You mean the programming cable? I do have that, I just don't carry it around in the pouch, it stays in the shack where I would do any programming. Now if you're talking about a cable for audio & PTT for digital operation then no, I don't have a cable for that, I don't plan on digital operation with this rig :) I will dig out the Arrow Antenna though and try some satellite action one of these weekends when I have time...

Later, 73

I'm sorry but I don't agree this is a significant issue. The difference is only 100Hz, which on FM is unnoticeable. If we were talking CW then yes a difference would be noticed....

From: g4ilo
Topic: 2411 Message: 2504

I think it is a significant issue because we don't know what gets written to the radio when this happens. It probably doesn't expect a number with that many digits. I don't know if there is a contact address but someone ought to tell whoever wrote the program about this issue, and the one I discovered that affects programming the priority channel.

Unfortunately it is almost impossible to trace the pads because the circuit board in multilayer type. Mere scraping the pads didn't help with my case, I had to bend the circuit board back and forth to turn the radio off.

While I haven't tried writing this to the radio, I used the software to create a channel with a RX of 154.690 and a TX of 154.890 just to see what would happen. I then saved the file to disk and examined it in a hex dump. First of all, as soon as I finished typing 154.890 the software changed it to 154.88999, so I can confirm the problem (using the latest download from 409Shop, which says 1.08 on the setup program, but 1.07 in the about window).

The file saved by the software stores the RX frequency and the offset. Looking at the file showed that the offset was indeed 0.19999 instead of 0.2, so the rounding error is being propagated to the image file.

From the first time I looked at the UV-3R data file, I strongly suspected that it was just an image of what is in the radio. A glance at the CHIRP source tree seems to confirm this (as it defines a data structure that matches what I had eyeballed from my initial poking around).

So... my conclusion is that this rounding issue will be propagated to the radio if you should write the image, and that your TX frequency will be off slightly, since the radio actually stores the channel internally as an RX frequency with an offset to the TX frequency, rather than having discrete frequencies in the memory channel.

As a short-term workaround, one could save the image to the radio, then manually edit the channel settings on the radio (i.e. change the offset) and then save the memory location again. Of course this would be overwritten the next time you wrote the image to the unit with the software.

My guess is that the frequency on the radio is a real number, not using actual digits, as you see on the display. The radio has a computerized display and I'm betting the frequency really is set to whatever the software tells it. Without seeing more about how the radio perceives these numbers, though, it would be really hard to tell.

I think it is a significant issue because we don't know what gets written to the radio when this happens. It probably doesn't expect a number with that many digits. I don't know if there is a contact address but someone ought to tell whoever wrote the program about this issue, and the one I discovered that affects programming the priority channel.

Hello Julian...

Did you test the 401 and if you did, where does it dip... I didn't buy one but found it and the specs seem to be very similar to the 666.

Like I said, a bit beefier though...

But the SWR dip is quite a way off 145MHz resulting in a poor SWR costing you 3 or 4dB compared to the 701. It is too high in frequency, hence too short so I couldn't try bringing it to resonance by shortening it.

From: jerry
Topic: 2482 Message: 2515

Has anyone tested the Pryme RD-98 Antenna? The overall length is 16.75". The diameter of a #2 pencil lead. Flexible and covers 146 and 440 MHz. It is a little pricy at $28.00 but I have used them on all my HTs including the UV-3R and I seems to be able to get into repeaters where no one else can with their HTs.

> While I haven't tried writing this to the radio, I used the software to create a channel with a RX of 154.690 and a TX of 154.890 just to see what would happen. I then saved the file to disk and examined it in a hex dump. First of all, as soon as I finished typing 154.890 the software changed it to 154.88999, so I can confirm the problem (using the latest download from 409Shop, which says 1.08 on the setup program, but 1.07 in the about window).
>
> The file saved by the software stores the RX frequency and the offset. Looking at the file showed that the offset was indeed 0.19999 instead of 0.2, so the rounding error is being propagated to the image file.
>
> From the first time I looked at the UV-3R data file, I strongly suspected that it was just an image of what is in the radio. A glance at the CHIRP source tree seems to confirm this (as it defines a data structure that matches what I had eyeballed from my initial poking around).
>
> So... my conclusion is that this rounding issue will be propagated to the radio if you should write the image, and that your TX frequency will be off slightly, since the radio actually stores the channel internally as an RX frequency with an offset to the TX frequency, rather than having discrete frequencies in the memory channel.
>
> As a short-term workaround, one could save the image to the radio, then manually edit the channel settings on the radio (i.e. change the offset) and then save the memory location again. Of course this would be overwritten the next time you wrote the image to the unit with the software.

Well that would certainly put it out of the range for the 2 meter band here in the States. Weather stations occupy that area and like you said, kind of hard to lengthen them :/

But the SWR dip is quite a way off 145MHz resulting in a poor SWR costing you 3 or 4dB compared to the 701. It is too high in frequency, hence too short so I couldn't try bringing it to resonance by shortening it.

I do my testing of HT antennas holding the antenna analyzer. If anything you should see better performance on the analyzer than on the radio because the analyzer is bigger and provides more of a ground plane.

The power switch goes to the CPU via a 1k resistor, R38.
A 'dry' joint on that is more likely than a track fault, and a bit easier to find
There have been reports on here of other such problems.

Unfortunately it is almost impossible to trace the pads because the circuit board in multilayer type. Mere scraping the pads didn't help with my case, I had to bend the circuit board back and forth to turn the radio off.

> I had to bend the circuit board back and forth to turn the radio off.

That is exactly what happened when I was troubleshooting a non-working VHF RX chain. Simply removing the board from the aluminum case fixed the problem. Then I laid it on the workbench, fully powered and with a small antenna, tuned to a frequency with a carrier and started pressing components until I could find the culprit.

A VERY gentle torsion of the PCB was also curing the problem, exactly as experienced by Reijo.

With the on/off button it should be harder to do, because you need to apply pressure on one point, or find another way to keep it pressed.

It is amazing how we are servicing these RTXes since the warranty is anti-economic. :-) And the most common fault seems to be a cold solder joint.

Good luck.

Some promo pieces are out mentioning the Baofeng UV-4X. From looking at the literature http://www.vgc.hk/pic/UV-X4.PDF it looks like functionally this model is same as the "Mark II". Only visible difference seems to be modified shape of push buttons to look similar to those on the so called UV-100/200. Anyone see it different?

My UV-3R (not Mark II) worked fine, no modifications needed, the programming software was fine, and I do have to or want to tamper with it. It's a fine appliance and tool and great deal.

Maybe hams are inclined to experiment with a radio that is practically "disposably priced" at $30, but the rig is great, not inferior in any way and a super value.

I'd like to see the Chinese design, develop, market some excellent values HF rigs that'll give the overpriced Big 3 a run, like they did with this HT.

To John

I think it is one of the best radio's I have seen, the audio is very good, receiver sensitivity is good, a little interference noise and the radio can be programmed (with some hick-ups).

My UV-3R worked right out of the box. It came with dedicated UHF and VHF antennas, and it doesn't do any sort of automatic repeater splits, but those are just inconveniences. Within 10 minutes I was on the air with my local repeater haunts in the memories and raring to go. A few days later, my son KJ4DXK and I were testing the range of the radio HT to HT simplex down the long halls of an airport.

Yes, many of us (mostly the silent ones) received radios that did exactly what we paid for. Maybe we are all putting out a spurious 1st harmonic (capacitor) and we live with audio that's a bit LOUD on receive (resistor replacement) and quiet on transmit (rounding out the microphone hole), and we may have picked up a 3rd party dual-band antenna, but I'm sure that there are LOTS of members here that are quite satisfied with our non-modified purchase.

From: Jelle
Topic: 2464 Message: 2533

Two Channels on the mark II?

First you need to set DW-mode On.

The radio has two choices:
#1. VHF VFO and UHF VFO mode,no need to program.
#2. Channel and VHF mode, needs to be programmed

If you have made choice # 2, then Dual Watch can only be done between a channel and VHF mode.

From: N7LN (Darvell)
Topic: 2464 Message: 2534

I brought my VX-8 to work with me, so I can't refer to the radio, but you need to turn on the dual-watch
feature. It is marked as DW in the menu. The radio will momentary switch to the second VFO occasionally.
I don't think the radio can actually listen to both channels, but rather it fakes it (is that true?).

That is exactly what happened when I was troubleshooting a non-working
VHF RX chain. Simply removing the board from the aluminum case fixed
the problem. Then I laid it on the workbench, fully powered and with a
small antenna, tuned to a frequency with a carrier and started
pressing components until I could find the culprit.

A VERY gentle torsion of the PCB was also curing the problem, exactly
as experienced by Reijo.

With the on/off button it should be harder to do, because you need to
apply pressure on one point, or find another way to keep it pressed.

It is amazing how we are servicing these RTXes since the warranty
is
anti-economic. :-) And the most common fault seems to be a cold solder

joint.

Good luck.

I have had my UV-3R since June and it has performed flawlessly. I have gotten my $48
worth and much more. It programs easily with the native Baofeng software and CHIRP.
Its a great grab and go radio and stealthy enough to take everywhere.

Agree totally with the other posters. Mine works fine, and also it feels
solid, not cheap thin plastic.

When building 2 meter antennas I attach them to the end of my SWR meter and hold to my face. That way, they are tuned for expected field conditions on the HT.

It did not work well for me holding the analyzer or with a tiger tail on the analyzer. Only on my little ground plane did I get good results. Anybody else have comments on this?

Subject: [UV-3R] Re: Nagoya NA-666 dual band antenna

I do my testing of HT antennas holding the antenna analyzer. If anything you should see better performance on the analyzer than on the radio because the analyzer is bigger and provides more of a ground plane.

Has anyone tested the Pryme RD-98 Antenna? The overall length is 16.75". The diameter of a #2 pencil lead. Flexible and covers 146 and 440 MHz. It is a little pricy at $28.00 but I have used them on all my dual band HTs including the UV-3R and I seems to be able to get into repeaters where no one else can with their HTs.

My UV-3R worked right out of the box. It came with dedicated UHF and VHF antennas, and it doesn't do any sort of automatic repeater splits, but those are just inconveniences. Within 10 minutes I was on the air with my local repeater haunts in the memories and raring to go. A few days later, my son KJ4DXK and I were testing the range of the radio HT to HT simplex down the long halls of an airport.

Yes, many of us (mostly the silent ones) received radios that did exactly what we paid for. Maybe we are all putting out a spurious 1st harmonic (capacitor) and we live with audio that's a bit LOUD on receive (resistor replacement) and quiet on transmit (rounding out the microphone hole), and we may have picked up a 3rd party dual-band antenna, but I'm sure that there are LOTS of members here that are quite satisfied with our non-modified purchase.

The radio is fine - the challenge is in the software and getting the USB cable to work. That is all surmountable.

If you lurk on any radio list (including the fabulous K3), there is always a lively discussion of how to make it better. Such discussions are just part of the ham culture.

I brought my VX-8 to work with me, so I can't refer to the radio, but you need to turn on the dual-watch
feature. It is marked as DW in the menu. The radio will momentary switch to the second VFO occasionally.
I don't think the radio can actually listen to both channels, but rather it fakes it (is that true?).

> I had to bend the circuit board back and forth to turn the radio off.

That is exactly what happened when I was troubleshooting a non-working
VHF RX chain. Simply removing the board from the aluminum case fixed
the problem. Then I laid it on the workbench, fully powered and with a
small antenna, tuned to a frequency with a carrier and started
pressing components until I could find the culprit.

A VERY gentle torsion of the PCB was also curing the problem, exactly
as experienced by Reijo.

With the on/off button it should be harder to do, because you need to apply pressure on one point, or find another way to keep it pressed.

It is amazing how we are servicing these RTXes since the warranty is anti-economic. :-) And the most common fault seems to be a cold solder joint.

Good luck.

Topic: 2464 Message: 2544

Update:

I've spent a couple of hours trying to find the problem. Below is what I did. Have a look and let me know if you agree with my conclusions (especially for the identification or R38).

First, I removed the board from the metal case. I had to remove
the four screws, remove the nut from the volume control potentiometer and unsolder the antenna connector.

I then tried to find the IC to which the on/off button connects to. It turns out that it's under the LCD, so I removed the LCD by removing the two small screws.

As I understand it, pin 29 of the IC is the 4th from the top of the right side.
See http://kkioftes.homeip.net/ham/chip.jpg
(photos are in high resolution, so that you can zoom in)

Then I had to find R38... I set my multimeter on buzzer and tried to see which resistor connected to the inside circle of the on/off button. I found that it's the resistor below the pad where the +ve battery terminal connects.
- it's connected to the on/off button
- the other side is connected to pin 29 of the IC (if I measured it correctly. It would be convenient to have four hands for this checks...)
- It measures 1K ohm.
- It also shows that one side is not soldered properly.
See http://kkioftes.homeip.net/ham/R38.jpg

I tried to solder it, but it seems that I did not make it, because the problem persists. I'll try to take the board to a local repair shop next week, to see if they can help me solder or replace the resistor and perform more tests.

Not to debate, but I don't entirely agree with "you get what you pay for".

With the UV-3R, I get more than I sure paid for.
While with the Big 3, I think we overpay for what we get, bugs, problems and all.

Either way, no matter what you pay, it's not perfect.
So, why pay more ?!

agreed, the UV3R is one of the most value for dollar HT's I've ever had.
The thing is so small and light, that I forget it's on my belt most of the time until it chatters, or until I sit down and the antenna pokes me lol.
Grabbing one of my $300 plus HT's, they feel huge and bulky, even though when I first got them, they were far smaller than anything else out there.

I was at a local ham fest last weekend, and had my uv3r. The hams I went with also had their UV3r's, and there was allot of interest in the little radios.
They haven't really wormed their way into the ham consciousness up here yet, but it won't be long.

They are limited in what they can do function wise compared to real amateur HT's, but for simple communications and monitoring, they're perfect.

I bought mine when they first appeared on the market. I couldn’t resist getting one at the price.
I thought that at the price, if the radio wasn’t very good then it wasn’t too much money to waste.
Out of the box it just worked exactly as described. Very simple to use. Not too difficult to program. Excellent transmit and receive audio. Antennas work very well for the size. An advantage of the single band antennas is very good performance for the size. Very difficult to get a dual band antenna of similar size that works anywhere near that well.
Many complain that you get what you pay for. I think you get way more than what you should expect at the price of these radios. What else is there?
I have a Yaesu VX6 and I don’t use it because of the extremely poor transmit audio. I have a Wouxun KGUVD1 which also has very poor transmit audio. These cost a lot more than the UV3, especially the Yaesu!
My only criticism is that the UHF band stops at 470MHz. I would like coverage to 480MHz so I could monitor some frequencies in the 470 to 480MHz area.
Would I recommend to others? Yes.
Would I buy another? Yes.
Do you get what you pay for? No. You get much more!

Grant, ZL2BK

Kieran,

Using the programming software, I think you must set your Frequency Range to "V+UHF1"; you also need to be sure that you have selected the proper Tx tone so you signal will open the desired repeater. And, verify that you have the proper Split Frequency and offset direction (+ or -) set. If there are other requirements, I trust that others will jump in and mention them, as well.

Hi,

I just got my UV-3R and I'm charging the battery right now. I did get a computer-programing cable but no software was in the box. Where can I get the software?

To clarify things... the U/V button toggles between VHF VFO, UHF VFO, and memory channels. On FM, just between FM VFO and FM memories.

Before I got the programming cable, I simply set down a list of local repeaters, organizing them by RX frequency, offset, shift, and PL tone. Went pretty quickly. Since the scan rate of the Baofeng is fairly slow, I settled for the 8 or so local repeaters, and the National Calling Frequencies for 2 meters and 70 cm.

You can get the offset direction out of the ARRL Repeater Directory, or off of one of the on-line sites for repeaters.

Hi, I see alot of people posting they got the UV3R for $30. Can I ask the group were you purchased it for $30? I have seen some on Ebay for $35, but shipping was $12 bring the total to $47.

Thanks,
Steve

If the shipping was added the the cost - then the radio cost $31 plus shipping??

I have not seen any radios for $30 at my front door.

Bay. Wald,

As I told Steve in a PM: I tend to believe the manufacturer over the various and sundry resellers. However, since I own neither a Mark II or a UV-4X, I can't verify how different either is from my humble UV-3R (Mark I).

Yes- we've already seen a tendency for this unit to acquire multiple names (for marketing, one assumes). Without any more information, it's therefore reasonable to assume that this is just another new name. My HT, advertised as a UV-3R, is sold under the brand "Magiksun" instead of "Baofeng." There appears to be at least one other different brand from reading this thread.

From: N7LN (Darvell)
Topic: 2528 Message: 2564

Has anyone used a UV-3R as an RF link into EchoLink? I'm thinking it would be fairly easy to do using a hacked speaker-mic. You would connect into the speaker-out to feed radio audio into the computer, and use the mic-in and turn on the vox mode to feed audio from the computer to transmit to the radio, so that the computer could communicate both ways with the radio over EchoLink.

I would need a better antenna than a ducky--maybe even a roof mounted antenna. I'm trying to think of why this wouldn't work and can't come up with anything--but I'm fairly new to EchoLink. It would only provide VERY local coverage, though, with only 2 watts out.

Any thoughts on that?

Darvell (N7LN)

Yes. I've thought of using an old HT as an EchoLink node. The problem is if is connected in to a repeater or a conference such as IRELAND then it will be transmitting with 100% duty cycle and HT's are not designed for that. It will get very hot and blow the finals. I use a Kenwood TM-D710. Half of the radio is a heat sink and it has a fan that runs all the time during TX as well. And it still gets quite warm.

I use my UV-3R to talk through my node. It's great for that, but if Vero/Baofeng made a version that had a DTMF keypad I'd have my credit card out faster than you can say EchoLink.

Julian, G4ILO
who also can't have too many HTs!

Intermodulation is my biggest gripe but my Yaesu VX-7 suffers from the same malady although to a lesser degree. For a sum total of $44 with shipping it is a bargain and a lot of fun.

You could use a Signalink soundcard. The PTT from soundcard should trigger the radio etc

Subject: [UV-3R] UV-3R and EchoLink

Has anyone used a UV-3R as an RF link into EchoLink? I'm thinking it would be fairly easy to do using a hacked speaker-mic. You would connect into the speaker-out to feed radio audio into the computer, and use the mic-in and turn on the vox mode to feed audio from the computer to transmit to the radio, so that the computer could communicate both ways with the radio over EchoLink.

I would need a better antenna than a ducky--maybe even a roof mounted antenna. I'm trying to think of why this wouldn't work and can't come up with anything--but I'm fairly new to EchoLink. It would only provide VERY local coverage, though, with only 2 watts out.

Any thoughts on that?

Darvell (N7LN)

That's a good point that I hadn't thought of, Julian. Probably not a good idea, then.

The problem is, I've contacted the local frequency coordinator about creating an EchoLink link, and since I live in a higher population area, there are no 2m frequencies available for something like this, but I was offered a 438Mhz frequency. The only 70cm equipment I have are HT's. Guess I need a 70cm mobile unit.

Yes. I've thought of using an old HT as an EchoLink node. The problem is if is connected in to a repeater or a conference such as IRELAND then it will be transmitting with 100% duty cycle and HT's are not designed for that. It will get very hot and blow the finals. I use a Kenwood TM-D710. Half of the radio is a heat sink and it has a fan that runs all the time during TX as well. And it still gets quite warm.

I use my UV-3R to talk through my node. It's great for that, but if Vero/Baofeng made a version that had a DTMF keypad I'd have my credit card out faster than you can say EchoLink.

Julian, G4ILO
who also can't have too many HTs!

I just got my second one, which works great. The size and performance can't be beat for something easy to drop in your pocket.

I have had exactly zero problems with either, and the programming is pretty comparable to the Wouxun, versus a Yaesu.

I have a pair of Wouxuns and three Yaesu's -- all for really different purposes.

Could you give me a" Dummies Guide" to entering this local repeater.
So far I have nothing programmed into rig.

I've tried with the manual ,but obviously I'm missing something.

output: 147.33
input 147.93
pl tone 156.7
I am programming it manually I'm not clear what buttons to push.
Thanks in advance.

To clarify things... the U/V button toggles between VHF VFO, UHF VFO, and memory channels. On FM, just between FM VFO and FM memories.

Before I got the programming cable, I simply set down a list of local repeaters, organizing them by RX frequency, offset, shift, and PL tone. Went pretty quickly. Since the scan rate of the Baofeng is fairly slow, I settled for the 8 or so local repeaters, and the National Calling Frequencies for 2 meters and 70 cm.

You can get the offset direction out of the ARRL Repeater Directory, or off of one of the on-line sites for repeaters.

Hi David

I can't see what you're getting at. The original is 1200mAh so this Fuji branded one is 85% of that. For ?2.99 delivered I'll go with that rather than a cheap unbranded one which claims more.

This brings me to another query. There are Baofeng branded batteries on Ebay but the one supplied with the radio is unbranded. Did anyone get a Baofeng branded battery in their radio?

Ok, make sure you are in VFO mode for 2 meters. Should show NO channel number. Press/hold U/V key long enough to get there -- it will cycle through memory mode, UHF, VHF.

Lift knob and rotate to get desired frequency. For 1 mHz steps (saves some time!), press function key, then rotate knob. Do that again to get back into normal frequency mode. I assume you are LISTENING on 147.33??

You may need to set the step value to 10 kHz, as I think the default is 12.5 kHz.

Press menu button, and rotate knob to get TX pl tone. Press U/V button to enter that menu option. Select 156.7 by rotating knob. Press PTT to select that value.

Same drill, set offset to 600 kHz.

Again, set shift to "+", which shift xmit UP 600 kHz.

Pressing PTT should bring up your repeater. If not, check you settings. JUST the receive frequency should be enough to hear your repeater. If you have another HT properly programmed, use that to key up the repeater for testing. I know, "kechunking" the repeater is bad manners, but....

If all is well, then store your setup in memory. Press F/A button on side, then U/V. Rotate knob to desired channel (you should have made a list), press U/V again.

That's it!

I would STRONGLY suggest setting down a list of your repeaters by RX/TX, PL tone, offset/shift, name for future reference. A spreadsheet will suffice.

If you have more than 8-10 repeaters to enter, get the cable (cheap), and the software (free). Saves a LOT of work.

Don't forget, the 70 cm offset is 5 mHz generally.

Also, put in the National Calling Frequencies for 2 meters and 70 cm.

Does that help?

Once you understand that there are these elements to each repeater:

1. Receive frequency (what you listen to)

2. Transmit frequency - offset from RX

3. PL tone (if needed)

4. Shift direction - + or -

5. Offset 600 kHz or 5 mHz

You are good to go. BTW, for satellites, you DO need the software, and in that case, you usually go UP on 2 meters, and DOWN on 70 cm, so you program TX and RX directly and independently.

Squelch, Power, Bandwidth (W/N), etc., apply across the board, and are not specific to any channel. Somewhat different approach than what is used on a Yaesu and other "main line" HTs. The Wouxun is much like the Baeofeng, so having had two Wouxuns, the learning curve was pretty simple for me.

It is also wise to get an understanding of just how/why a repeater is set up like it is.

I think you're better off buying a cable; in building your own cable,
your first challenge will be to find and buy the Prolific IC chip that
you need between your PC and your radio for reading & writing to the radio.

Sort of depends on what you have lying around on the bench.

You need a 3.3V RS232 connection to your computer. I used
http://www.sparkfun.com/products/9873 because it was sitting around on my
bench from an Arduino project and because my laptop doesn't have any serial
ports. The 3.3V levels are an important thing to get right, the processor
in the UV-3R does not tolerate 5V signals.

And you need a four conductor audio plug that mates with the SP/MIC jack on
the radio. I cannibalized a cheap RadioShack cell phone headset. But I was
lucky, because the headset only connected to the three bands of the plug
that I needed.

Numbering the conductors on the audio plug from 0=TIP to 3=BASE, you connect
the serial RX and TX to 0 and 2, GND to 3, leaving 1 unconnected.

If you get RX/TX backwards -- like I did the first time -- then it won't
work. But no harm done, swap RX and TX and chirp was happily cloning the
channel configuration a few moments later.

But, as the man said, you may be better off buying an assembled cable.

You will be surprised at the performance of the Baefeng. I have used mine for LEO satellite work. Remember, that the difference between 2 1/2 watts and 5 watts is only 1/2 an "S" unit (one "S" unit is 6 dB, IIRC). The receiver is as good as my Wouxuns or Yaesus.

Due to the size of the Baofeng, I'm more inclined to drop it my pocket when going out, versus the larger units.

With the right antenna, it is hard to beat.

Subject: [UV-3R] Possible To Program From Radio?

I have owned Kenwood, Radio Shack, Icom and Yaesu HT's. I have never owned cables or software in order to program them. Yes, it was a pain in the arse, (especially Yaesu) but with the manual it was possible. Is it not
possible to program the radio without these "extras?" I don't want to call anyone lazy, but is that all the problem is?
I hate to buy items I will use once or twice? I have plenty of patience and time.<G>

Yes, you can do all the programming from the keypad and if you only have a few frequencies to enter, I suppose you could get the rhythm of it.

On the other hand, the programming cable is cheap and once you get the drivers straightened out, you've got a very easy way to program the radio and reprogram it, if you mess up.

From: Naqoyqatsi (aka the ICM)
Topic: 2601 Message: 2601

As most handy-talky owners tend to have more than one and normally of different brands just a quick nod to let you know that whilst the UV-3R cable won't work with the Alinco DJ596 (and vice versa) the CHIRP software package does.
In fact I took my UV-3R channel list, saved it as a CSV file then was able to load those same channels and settings into the Alinco via it's own cable and CHIRP.
A brilliant piece of freeware.

Also does anyone know if it is possible to program the Jingtong JT208 other than by hand?

2602. Baofeng as a remote for hand driers ? :)

Yahoo group: UV-3R (2011)
Date: 2011-10-10 08:05:01 UTC
From: Nuno Xavier
Topic: 2602 Message: 2602

Hello everyone
This is my first post here.
I got my UV-3R a couple days ago, from 409shop. It came from HK to Portugal in about a week. That's fast!
It came with USB cable and a mic+speaker and the usual 2 antennas. But I already have one Midland Flex antenna (144/430/300/800/900 Mhz - used it on my PMR radios).
Living near a big port, I can listen to port control / ships VHF communications. The receive sound seems to have good quality.

I have 3 questions:
1 - when I press the ptt around 144.0 and 145.0 the "hand driers" at my work toilets start to work, then stop when Ptt is released.
I am standing in a different room, around 6 to 8 meters away. Should this 'interference' happen?

2 - Local port VHF channel table reads: channel #60 (Tx 156.025 - Rx 160.625)
This is the channel port control uses after calling the ships on #12 (Tx-Rx 156.600)
When I'm listening on #12 I can hear both port control and ship, but when listening to #60 I can only hear port control .
Shouldn't I be able to listen both?

3 - I have already connected the radio to the PC. Once I could figure the right Com port, it was easy. But then I tried to program the radio manually (not connected to PC). After this I'm having difficulties connecting the radio again to the PC.

thanks in advance for your answers.
Nuno

2603. Re: Baofeng UK Dealer

I wonder if they warn their buyers about the little niggles,
like poor 2m harmonic suppression or the lack of proper audio out the
ear socket ?

It's one thing to be a buyers like us, who scout around for bits
of equipment to suit us and know what we're getting, but it's
another when your average bozo see's an advert for a rig and
assumes that everything's gonna be ok. (Does that make sense ?)

Hi Mike. I programmed twenty calling frequencies and repeater frequencies on both 2m and 70cms manually. The 2m repeaters didn't give a problem as they were all 600kHz offset. However, some of the 70cms repeater had a 7.6MHz offset, and it takes an age to change the offset frequency by such an amount.

So..... I got organised and did all the 7.6MHz offset repeaters all at once. Took about 30 minutes to do the twenty, as I did thoroughly check each one was correct, but I must say I did enjoy the experience!

For UK users there is an Android app called REPEATER which has every UK repeater in with full details - and in SETTINGS you can decide which repeaters are shown on the screen i.e. just 70cms or 2m and 70cms, Analogue, D-Star, IRLP etc etc! It even shows how far the repeater is from your location.

https://market.android.com/details?id=com.zbm2.repeater&feature=search_result

BTW, the author, Nicolas M1HOG, welcomes repeater lists from other countries to incorporate them.

Anyway, as some users have mentioned, with manual input you can't set a freq. on one band for TX and the RX freq. on another band. But if you want straight programming you will 'get into the rhythmn' doing it manually :)

2608. Battery alternatives

Yahoo group: UV-3R (2011)
Date: 2011-10-10 11:25:30 UTC
From: vimproved
Topic: 2608 Message: 2608

Still waiting on my uv-3r to arrive I have just had a thought.

1. Does the Yaesu FBA-37 battery box fit the 3r?

If so, it could be beneficial for some to build a dual-battery. I.e. Buy 2 reputable Nokia replacement batteries, wire them in parallel then squeeze them inside the FBA-37 box (after cutting out all the AA guides.)

Batteries available are:

BL-5C:53.05mm x 33.84mm x 5.62mm
BL-6C:53.25mm x 33.9mm x 6.30mm

As an AA battery is 14.5mm x 50.5mm you could possibly sandwich two into the space.

Considering that the BEST BL-5C replacements are 1250mAh (scud, japod, etc) you could end up with a battery of 2500mAh. According to the standby on a stock battery this gives a 20h operation time!

Who is willing to give it a go?

I know there have been many posts regarding other brands of radios where owners have difficulty with Windows recognizing or working correctly with USB cables if you are also using a serial to USB adapter. My PC is has serial ports as well as USB and serial is what I use for my Yaesu radios. When I order a cable for the UV-3R I will also order a serial version. There generally is less headache with serial.

But also don't forget the dealer is buying them in at trade price. Thats where the Chinese are happy in making a smaller profit and selling plenty, and you come back for more, where as ye olde Western Dealer likes a big huge ripoff profit to keep him in with the BMW or Merc dealer for the nxt years model.

After further thought there is an even easier way to do this.

http://www.ebay.co.uk/itm/4-ICR14500-14500-3-7V-1200mAh-rechargeable-battery-B-/150666691601?pt=UK_ConsumerElectronics_Batteries_SM&hash=item23146f4411

These are AA sized Li-ion cells. That means they will fit into the battery box without chopping the plastics of the box. All you would have to do is modify the joining wire strip to connect the batteries in parallel instead of series. At 1200mAh this would create a 3600mAh battery, more than 300% the original size (although I am HIGHLY dubious the original battery is >1000mAh, the chinese have a habit of lying about their battery capacities). Further more they can also be charged in the radio with the standard charger.

Whether these batteries ARE 1200mAh or not is debatable. I see 'protected' 14500 cells are 900mAh so this is quite possible.

The fact they are unprotected simply means they MUST be used with a smart Li-ion controller chip. This will stop them being charged >4.2v and discharged <3.2v.

I do not know how smart the charger chip is inside radio, I imagine it would be adequate but I would need to check the data sheet to make sure.

From: Andy
Topic: 2608 Message: 2616

I use the FBA-37 Yaesu Standard Vertex battery case and after filing the notch to clear the belt clip, it easily held the 3 rechargables at 2500 ma each. I got 16 hours of continous use the first charge... I can't imagine how long it would last just listening without transmitting.

See my photos labled " kb8ibs " also found a neat pouch for $6 to hold all the accessories I use with my little UV-3R.

I also found a source for the NP-60 / SLB-1037 for $8 for 2 delivered, right here in the USA... My UV-3R came with a 1500 ma battery and the NP-60's are 1200 ma but you really won't notice the difference.

http://www.ebay.com/itm/2x-New-Battery-Samsung-SLB-1037-1137-DigiMax-Camera-/290607529523?pt=Batteries_Chargers&hash=item43a98efe33

Haven't tries stacking them though, I guess you might be able to get 2 of them into the Yaesu or aftermarket battery case if you carefully parallel them. I do know if you breech the lithium ion case though, you are likely to get burned, especially if you are the type that itches your eyes, or rubs your nose while working on electronics, lol :D

> My two Baofengs have both come pre-programmed with a whole bunch of channels, which don't make a lot of sense. Any insights from the group?

One had the same: 20 memories (1-20) programmed and no way I could
program a memory channel above 20. A reset cleared them and opened up
all memories. This device was defective on VHF RX (cold solder joint,
fixed) and the LCD protective film had some scratches on it. Sounds
like it was a returned unit...

The second one had clear memory channels and I could write to any location.

Note: I do not own/use the programming cable.

Ha ha! Reminds me of a British ham I met on holiday in Malta who was renting the apartment above and had borrowed a rig off a friend to operate. He was obviously very much into ham radio, in fact obsessively so.

He had a nice young lady with him, and told me the story that when he was married to his wife he'd been on the radio so much that she, too, said 'Either me or the radio'. So he said 'Bye love' (I guess in the States that would be 'Bye Honey'), and so she went straight outta the door! The divorce soon followed.... :)

So Lee.... be careful! :)

That is good to know. If your 2500mAh battery lasts 16 hours, you can infer that a 3600mAh battery would last around 23 hours. That coupled with the fact it can be charged IN radio means this is possibly the best choice.

Li-ions are pretty safe as long as you don't puncture/short/heat them while you are playing.

Topic: 2622 Message: 2622

Hi all, I am a new member and have just received my UV-3R bought here in the UK from www.czechmorsekeys.co.uk after having spoken to the owner of the business at the Hamfest at Newark recently. I recomend his web site as it gives access to some handy downloads, data etc. The price I think you will also find attractive ! My radio has the dual display of the UV-X4, but the key shape is that of the UV-3R. The battery is a 1500ma. The brand name is in chinese of course.The radio performs well and as yet no intermod problems that I can find ! I am very happy with it, as others have said,you get what you pay for ! Although in this case I feel I have got rather more than less !!! I also have a Kenwood TH-F7, and the Baofeng compares favourably, price for price, and its receive is as good as the Standard C510 I have,in its day it was another under £100 qrp radio.
On the web url mentioned there is a circuit for an interface cable. The usb plus is shown as a Si Labs CP2102. Does this mean anything to anyone please ? If so where does one get one please ?
Many thanks to all, this is a great help to we UV-3R users, thank you,
Tony, G7VIG/M0VIG.

2623. Charging time?

Yahoo group: UV-3R (2011)
Date: 2011-10-10 18:11:46 UTC
From: Nuno Xavier
Topic: 2623 Message: 2623

Any idea of How much time is needed to fully charge the battery for the 1st time?
The radio is charging for a couple hours but the Tx light is not red as mentioned on the user manual. No s-meter on the display either.
There is only an animated batery icon.
Should I expect it to show a full charge batery icon when charging is complete?

Topic: 2624 Message: 2624

I have tried to program a local repeater input and output,etc into my UV3-R but I do not hear any sounds other than some "static" from opening the squelch. Same thing happens even if I just try to go to any frequency.

Any suggestions?

Would a factory reset help? I tried following the directions in the manual and it didn't work.

I'm sure I heard "voices" when I turned on UV3-R when I took it it out of the box last week.

Nuno, I assume you have no led on the walwart charger, if so then my experience has been that the flashing sequential battery icon on the screen will disappear when charged.

Yes, the charger has a LED on it.

this LED will light red when Charger is connected to the wall socket and radio. When radio plug is removed, charger LED tuns Green.
Is this what you mean, Steve?

How much time should I normally expect for a full charge?
This is the 1st charging I do. Battery had lost "factory" charge.

Hmmm,

In my case, when I first got into radio long ago, I was so obscessed about the radio --it didn't work out very well with my EX-husband. I had such disturbing habits as staying down in basement (shack) and stay on CW.. He even got a novice liscience <g> One of my sons even got a liscience when he was very young..

I was a mess...I even left in the middle of one of my kid's band concerts to take my 2 mtr rig to a friend for an immediate repair.

73,
KF3D/Sandy

P.S. Hard to believe I've been completely off the air for years..now I just bought the UV3-R and am spending all kinds of time trying to get it to work (sigh).

My poor dog has to wait hours for a walk and I'm sure my parrot will soon have some choice words for me about this <g>

Hello Chris and all,

Been lurking for a long time, so thought I'd reply...

I received a Mark II last week and found it way, WAY too loud on receive. And that menu/power-off beep could wake the dead!

Thanks to others in the group I ordered a little 'kit' of parts for lowering the audio levels and fixing the harmonic.

Anyhow, changing R13 to 33k helped, but I still find the volume too loud on the lowest setting (I'd use 47k next time). I sit in an office and really don't want to annoy others.

I also changed R10 to 1M and both C135/C136 to 4pf.

Anyhow, I can't compare this radio to the stock UV-3R, but if the original was any louder, I'd be even more stunned. Whoever pointed out these are used on job sites in China was on the money. You could hear this thing over a jackhammer! (Ok, not really - but close!)

73,
Gary
N4TXI

ps. My quick review: I'm very pleased with the purchase considering the cost. And the only reason I find to get the Mark II over a Version 1 is the dual-band antenna. The dual-line display is ok, but I could live without it. The one thing I hate: the siren/alarm! (I've turned it on by accident too many times - and it's embarrassing to have to apologize for.) To kill the alarm, I may remove R10 entirely, but unfortunately it means I may unintentionally lock the radio on transmit and not know, leading to an even bigger on-air 'oops'. Meh, I'll live.

One had the same: 20 memories (1-20) programmed and no way I could program a memory channel above 20. A reset cleared them and opened up all memories. This device was defective on VHF RX (cold solder joint, fixed) and the LCD protective film had some scratches on it. Sounds like it was a returned unit...

The second one had clear memory channels and I could write to any location.

Note: I do not own/use the programming cable.

The dryer issue is likely pretty simple. My paper shredder has a photo diode to sense when a piece of paper is in the hopper. When I key up my HT near it, the photo diode acts like a "crystal detector" and starts the shredder. Also, my wife's china cabinet has one of those "touch switches." The XYL is not delighted with this...

Same problem except at HF with my FT-817ND. Similar difficulties with the garage door opener, which I cured with some ferrite snap on chokes.

I think all of the above are "Part 15" devices in the US, and must accept outside interference.

"Accept" - Don't blow up or otherwise fail. Doesn't imply that they should ignore nor take no action when interference is received, does it?

I gave some simple instructions for programming in another message. I think we need to add something to our FAQ file, or a "dummies guide to programming" for the Baofeng. BTW, the Baofeng programming is essentially the same as a Wouxun HT.

If you see the "S meter" bar, but don't hear anything, you likely have the receive tone set on (tone controlled squelch), which should be off.

Typical example is somebody setting up one of the NOAA weather channels known to be active, and not hearing anything.

A complete reset won't harm anything, but not sure why it would be necessary, unless you are trying to get rid of the factory pre-programming.

Ah ha! That probably explains why my automatic soap dispenser starts spewing soap if I key up too close to it. :-)

I suspect that it is also uses a photo diode, as it detects the presence of your hand to determine whether to dispense the liquid soap.

I discovered this by accident one day as I was trying to hit a repeater from inside my house with an HT. I wasn't having any luck so I set the HT to high (5W). I just just happened to be near the kitchen sink, and right next to the soap dispenser. Since then I've learned that an HT on high anywhere within 15 feet will activate the dispenser.

I'll have to check out the local $1 store. I wouldn't bother with the cases designed for the UV-3R from the Hong Kong vendors. They're useless, in my opinion. Not even worth the shipping to get it.

Hey Paul, we all love a bargain, which is why we own at least one these HTs !

I have found some decent leather (sometimes) cell phone cases at the local Dollar Stores, and, I don't pay more than $1 for them either.

Subject: [UV-3R] Carrying case for Baofeng

Being the cheap SOB that I am, I picked up a nice, cheap ($4.95) cell phone case at Sears this morning back in the tools section. STURDY metal belt clip. Elastic sides. Black nylon. Cover has clearance for the antenna when closed. Cut off the "Craftsman" label, which is just sewn on. Perfect for dog walking...

Interesting to hear what gets switched on by HT RF. I was very startled when my paper shredder started up when I keyed up! It will always do that if I am ten feet away or less.

Chris,

I've not looked in the FAQ or searched the message base but I believe
that the button keys the rig just like the PTT would. It's an either/or.

Either works. With VOX, you just talk. You will have to fool around with the VOX setting for best performance.

The earpiece tends to pick up RF. Get one of the larger snap-on ferrite chokes at Radio Shack, and take THREE turns through the core. Put the choke up as close to the plug as you can.

Otherwise, the radio is liable to "lock up" on transmit.

I thought the black case went well with the Yellow HT. Now, something to set off my black one....

Will definitely check out the Dollar Store.

For a nice "GO" bag, the insulated nylon lunch bags work well. The one I have has a small zipper compartment in the side that holds cables.

Also, the plastic boxes used for fishing tackle/dry flies work well for adapters, etc.

You can never own enough HTs...

reason I'm asking is because the earpiece I got with mine when I press the button on the wire nothing happens. So I don't know if its just for listening with or what. I tried using the VOX function and that doesn't work either. I just wanna make sure that when I press the PTT and have the earpiece in that I can be heard when I talk out.

Just search eBay for "CP2102".

I made my interface cable using a Prolific adapter. It looks like a USB plug with a cable attached. At the other end are bare wires for GND, RXD, TXD and +5V. The Prolific adapters don't support RTS but you don't need it in this application. However given the problems some people have had with cables that use the Prolific chipset You would probably be wise to use the CP2102.

I agree. I have the leather case. It would be a nice case excpt that it is such a tight fit once you have got the radio into it you won't want to take it out again. If they had made it a tiny bit larger it would have been OK.

Charging time for the types of batteries it takes shouldn't be more than 2 hours at the very most.
Mine came with a 1500mah battery with 2 contacts and the 2 spare batteries I got separately have 3 contacts on the end. Probably for different applications. I did notice that when I use one of the spares the LCD indicator for the charging on the radio display seems to cycle faster than it does with the original battery.

But overall I haven't seen it take more than a couple hours.
I'm planning to build a solar battery charger to try for "emergency" usage.

No,
I mean an audio cable

-4 pin plug into UV-3R
to split cable
audio out jack (pc sound card)
audio in jack (pc sound card)

This way you can use it to get sound in your favorite software or TX via the audio out with the VOX enable
Not very far from a simplex repeater isn't it ?

wal

Yes Nuno, they are.

BTW, I'm not sure which hot country you're from but I think it's worth me mentioning that you shouldn't leave a fully charged Li-Ion battery in a hot enironment e.g in a hot car, on a window ledge etc. as they don't like it and it reduces their life....

(also.... a new one on me, but if the battery case gets a hole and you touch the Li-Ion you'll burn yourself...)

.d.

Hi Julian,

I appreciate the suggestion; turning off the menu/button beep setting was the first thing I did too. Alas, it does not disable the alarm function on my Mark II. If I hold the 'F/Alert' button too long (or instead of PTT, as has happened on one occasion), it still goes off. Perhaps I'm too fat-fingered for a little radio... nah - I still love it.

From: Lee - N9LO
Topic: 2666 Message: 2666

I was informed off list the sometimes when I reply the message I am replying to is not sent along with my reply. I have seen it happen a few times to other members but did not know I was doing it. I get individual emails to outlook 2007 and reply from there. It is set to include original text in replies and forwards. Is this happening to others and does anyone know of a fix? Thanks.

Lee - N9LO

No Wal, I don't have a cable for that...

That's what you would use to operate digital and yes, that would be very close to a simplex repeater :) Might also be very close to an EchoNode Link as well but won't use the little UV-3R for that either...

I carry mine around on the property, use it in the mobile with an adapter for the magnetic dual band antenna and basically experiment with it. I always do that with something new as I did the Wouxun, TYT and others :)

These type of chargers are switched mode power supplies and will normally work between about 90 - 250V.

Cover has clearance for the antenna when closed. Cut off the "Craftsman" label, which is just sewn on. Perfect for dog walking...

Hi Paul,

for which cellphone was this case originally intended? I've already
looked around for such a case, but current cellphones here in DL have
all different shapes.

Then I guess this is another "bug" that they "fixed" in the Mk II. With my radio if I hold F/A too long when BEEP is OFF the radio starts to transmit but there is no alarm sound either through the speaker or transmitted.

Oh yes, I remember now. When my charger is on a signal that's 5.9 goes down to 5.2 because of all the hash.

Ha ha, good joke Andy. For anyone not in the know there are no 1 pound notes issued now, they went out in 1984! Only collectors items ones now, so that's why Andy is so willing to do a trade!

The 1 pound coin looks like a doubloon, or gold sovereign, which was ousted in the war years because of austerity measures and replaced by the note.

The case I found was rather generic. Didn't fit my Motorola 'Droid. Looked to be for one of those more the shape of a computer mouse. I had my Baofeng with me when I got it, so it was a matter of seeing that it would fit correctly. The one I got is the sort of case that workmen/contractors use. Simple, rugged, elastic panels on the sides to help retain the cell phone.

Sort of like this:

http://www.constructiongear.com/cat-cell-phone-case-heavy-duty-cat000114.html?lsku=CGCAT000114&gclid=CKWZn_md4asCFQXe4Aod-EbkSA

Yup, that's the first think to check when you get no audio, but you get a receive signal. I've been bit by this issue before.

I recently purchased two old Yaesu FT-23R's from an eBay auction. Got a GREAT deal, too (even cheaper than the UV-3R's!). I plan to leave one in my car as my "throw away" radio, in case it gets stolen. I currently have it hooked up to a mag-mount on the back of my convertible.

Anyway, when I got the two radios, BOTH of them did exactly as you report. They both transmitted fine, but I would NOT receive--although the green receive light would come on and the S-meter would max out. I tried with my UV-3R, and yup, transmit was fine, but neither would receive. Nor would they talk to each other. Turns out they had different tones set for receive. I didn't discover that until two days later. I just got mad and put them back in the box for a few days, figuring I was going to have to leave negative eBay feedback, because the guy said the both transmitted and received fine.

Glad I waited--and glad I checked out the manual to figure out how to run them. (My dad and I had these same radios back in the late 80's, but hardly anything used tone squelches back then. I'm not sure I even knew what they were for. LOL.)

I'm happy to have some old great-working Yaesu's from my early days of HAM radio. Solid metal cases and still work great. They're actually pretty small, compared to other radios of the time.

From: rico567
Topic: 2681 Message: 2681

Got my radio today, about 10 days, inside the time frame advertised.....so, good work by Deal Extreme. Package was in good shape, everything in package (2 antenna, 18 item menu version) was intact, radio charging right now. Have programmed in a half-dozen repeaters, everything works as advertised. The loud minimum volume setting does need fixing....think I'll experiment with covering up portions of the speaker grill first.

Actually according to the data sheet the charging current is:

(Ibat)=(Vprog=Rprog)*1000

As Vprog is 1V and Rprog is 2K7, this would indicate the charging current is around 370mA.

If you wanted a faster charge time you could probably change Rprog(R24) to a 1% 2K resistor for 500mA charge current. This is an increase of roughly 1/3, this would reduce charging time by 1/3. In fact the charging chip can source up to 800mA however I don't know if it has the appropriate thermal sinking or how much the batterys life span would be reduced by.

2684. Re: Charging time?

Yahoo group: UV-3R (2011)
Date: 2011-10-12 10:06:43 UTC
From: g4ilo
Topic: 2623 Message: 2684

I measured the current drawn whilst charging the battery via the socket on the radio. It was >400mA, and the battery was not fully discharged. Having made up a USB to charger socket cable I tried charging from one of those MP3 player wall warts with a 5V USB output, rated 500mA, and the battery never fully charged. I then tried using a charger for a smartphone rated 1000mA and that was OK.

So whatever you charge it from I would say it needs to be able to supply at least 500mA.

Julian, G4ILO

I have been a ham for over 40 yrs. Guy we are talking about a $30.00 radio . Nothing your going do do to the charger, the audio is going to make it any more than a $30..00 radio , GOOD VALUE . mine THE VOLUME CONTROL WORKS FINE, THE CHARGE RATE IS FINE, IT WOULD BE NICE IF THE RADIO WOULD CHARGE WHILE SITTING CHARGER. BUT THEN AGAIN ITS A $30.00 RADIO RIGHT .

Hi Peeps,

Just my 2 cents worth.

I work through the circuit of the charger IC on LTspice and the charge current is about 150mA, which for a 1500mAh indicates about a 10h recharge time.....from "flat". I confirmed the current in the actual radio.

The "Desk Charger" is likely to be quicker, but it is NOT CONTROLLED , be careful !, as has been discussed before the 5V output from the adaptor is connected straight to the battery, so use with caution.

Cheers

Paul

Bought mine off of Ebay for $31 plus $10 shipping from Hong Kong, took 1-2 weeks delivery. Go to Ebay, search for Baofeng UV-3R, then select the results as lowest price first and you can see who is cheapest.

You may also consider the UV-3R Mark 2 which has dual dispaly and is about $10 more also on Ebay, some have reported some issues with them however, but the high volume complaint allegedly has been fixed with it.

I got mine on e-bay (search for 409 shop - http://myworld.ebay.com/mega409shop/?_trksid=p4340.l2559) and received it in 8-10 days.
I ordered the radio + mic/speaker pack, then asked for the USB cable via mail.
total costs between 40-45 euros

2692. Editor for DAT files?

Yahoo group: UV-3R (2011)
Date: 2011-10-12 18:02:16 UTC
From: Nuno Xavier
Topic: 2692 Message: 2692

I have both Chirp and Baofeng software for programing the radio.
Baofenf SW can only handle .dat files, while Chirp can handle 4 or 5 types of files, none of them being .dat files.
Do you know of any file converter/editor that either:
a) allows you to edit a .dat file, or
b) converts dat to csv or csv to dat?

Thank you
Nuno

2697. using the earpiece ::: resolved :::

Yahoo group: UV-3R (2011)
Date: 2011-10-12 19:47:23 UTC
From: - -
Topic: 2644 Message: 2697

I guess it helps to have the earpiece pushed in all the way.
Must be still faulty though because sometimes when I have it pushed in all the way and I need to transmit it stays locked in transmit and won't stop. I'll try with other external mic/earpieces in the future.
Just wanted to update what I found.

I don't even know what that means. How do you set that?

When I move to the 440 VFO on top, I set the frequency step, save it, and exit out, then go back into the menu, and the value hasn't changed. I go to the bottom with the 144 VFO and change the frequency step, then go to the top 440 VFO, and the frequency step is now set to whatever I set for the 144 VFO. Changing the frequency step on the top 440 VFO does nothing.

The Mark I allows different settings for UHF/VHF. My Mark II always uses the VHF setting. Am I missing something?

I am exploring that issue now, in an attempt to easily harmonize my HTs. CHIRP can save a file that it reads from a radio as a CSV (file type for Excel spreadsheet). Do your cut/paste/editing there, save it, then read back and load into the desired radio, I believe. Anyways, a place to start.

Also, you can just load the file with the Baofeng software (from WITHIN the program) and edit that as you please, sending it back to the radio and/or saving the file.

CHIRP is primarily an HT to HT porting program, as I see it.

I think you are going to have to do some "tweaking" of any common file, as the features, outside of PL tones, Xmit and Receive frequencies vary from HT to HT.

Paul,

Well, You're right about Chirp easing moving setup data from one radio to another, that's a big plus, however, I think Chirp is more robust that you're allowing.

The UV-3R software (version 1) forces me to enter both frequencies (Rx & Tx). Chirp on the other hand lets me enter the Rx freq, the offset, and the duplex setting (no/+/-).

Chirp let's you easily manipulate the lines in the file, moving up/down, editing them and/or deleting them. You can read the UV-3R .img file into a chirp file and then export that into a .csv file. This allows you to get very creative using MS Excel (or another spreadsheet program) to even more easily manipulate your data. Once you're happy, import your new .csv file into a chirp file and, finally, read that into your UV-3R and saving it in the radio. Of course, save each of the intermediate files.

The small limitation I see in Chirp is that it sets none of the radio-specific parameters (Sql Level, Vox Lvl, TOTimer, Key Tone, Battery Save, Scan Settings, Priority Channel, FM Radio Channel, Dual Watch, Backlight, BCL); it only sets the channel specific parameters [Rx Freq, offset, duplex, tone mode, tone (on Tx), tone-sql (on Rx), DTCS Code, DTCS Polarity, Mode & tune step]. Small inconvenience since each radio seems to its own idea about what to save and how to format it.

Hi, I ordered my UV3-Mark II at www.fleetwooddp.com in Canada. It cost a bit more than direct from HC, but I needed to be able to get basic help- as I am a new ham. Communication is fast and friendly. I told Bill my situation, and the radio arrived pre-tested and had a station programmed, so when I turned it on, I knew it worked fine. I received advice that saved me money on accessories. The Mark II was delivered well packed and within a few days of mailing. I am very happy with the radio and the service. Make sure you pay attention on the site, and indicate your country' s currency, be it Canadian dollar, US dollar, Euro and so on, so you have your correct price. I felt comfortable asking basic questions. The site has useful information as well. Thanks to all the experts on this board, too.

The staying locked in transmit is probably due to RF getting in via the earpiece cable. It's a common issue with the Mk I. There's a mod you can do to decouple the PTT line to ground, or you can wind a couple of turns of the cable trough a small split ferrite which is what I did.

2713. vhf marine channel 81

Yahoo group: UV-3R (2011)
Date: 2011-10-13 12:21:18 UTC
From: Nuno Xavier
Topic: 2713 Message: 2713

Please excuse my ignorance, but I have to ask this:

I live near a big sea port and can listen to port control / ships communication.

I programmed the UV3R with the Marine channels available on the files area. Checked them against the local port radio regulations and they check ok.

No, I have this doubt on Channel 81 ---- Tx 157.075 - Rx 161.675

I have my radio listening on 161.675, but... I can only listen to land part of dialog, not to ship.

Since I'm only listening, shouldn't I be able to listen both land and ship, as their transmitting uses the same frequency (the one I'm listening?)

Is my radio frequency wrong? Am I too far away from the ship? What can be the reason for this?

Meanwhile I found this international VHF table - http://www.ukseakayakguidebook.co.uk/short_articles/vhf_channels.htm
Note it reads :

*Transmitting Frequencies (MHz) - **
Ship Stations* *- Coast Stations*
81 157.075 161.675 duplex
Any help?
Thank you
Nuno

Channel 81 is a duplex channel. In other words, the ship station and
the coast station do not transmit on the same frequency. You would need
to list to both frequencies to hear the entire conversation.

'I have this doubt on Channel 81 ---- Tx 157.075 - Rx 161.675'

With this programmed you listen to 161.675 and transmit on 157.075.

If you program Channel 80 RX 157.075 then you will be able to hear both parts by switching back and forward between Channels 80 and 81.

Regards, Bob

Thank you for answers, Bob and Joe.
I'm guessing the "land" guy, who's contacting the ship, doesn't have to do this channel switching?
How is his radio programmed, then?
Am I missing something here?

As yours is, with different frequencies for Rx and Tx. But you don't want to transmit do you? So you will have to program two channelds with different receive frequencies.

From: aubreycttx
Topic: 2713 Message: 2718

If I am reading that chart correctly (and note that I'm not a marine radio expert), it doesn't work like a repeater. In this case, I am interpreting the chart to mean that the ship will send on 157.075 and the port will send on 161.675 (note the column headings, which lists both frequencies as "Transmitting Frequencies," with subheadings for "Ship Stations" and "Coast Stations"). So it's not a TX/RX repeater pair where both sides monitor the RX and where they switch to TX when transmitting (like the UV3R is expecting), but instead two discrete frequencies.

The only way for you to hear both sides would be to monitor both frequencies separately, as there is no way I can think of to make the UV3R monitor both in a single memory location. To make it work, I think you'd have to switch to the memory location you're using for Channel 81 (which will monitor 161.675, since you have that programmed as "RX"), then go to the ship frequency (157.075) on the VFO side of the radio (if you have a Mark II), then invoke dual watch mode. If you have a Mark I, then you'd have to set each frequency manually, then invoke dual watch.

From: Joe
Topic: 2713 Message: 2719

True. I believe that they do this so that the Land based transmitter always has a clear channel to talk to the ships on. Ships transmit on a different frequency that does not interfere with the land station.

2720. USB Cable needs to be modified

Yahoo group: UV-3R (2011)
Date: 2011-10-13 14:14:29 UTC
From: Joe
Topic: 2713 Message: 2720

After a frustrating hour of trying to get the cable from the USB port to the UV-3 to work reliably, I finally figured out that the plug that goes into the UV-3 will not go in all the way. The cable I got with the radio has a black rubber shoulder on the plug that stops the plug from going completely into the radio. Shaving off some of the plastic will allow it to go in and make good contact.

I seem to remember having a similar problem with my Yaesu VX7-R.

Nuno,

These frequencies do not work like a repeater which carries one-way (simplex)speech.

Communications between ship and shore is both way - each end is receiving and transmitting at the same time.

On the frequency pair you have used the ship is set to Tx on 157.075 and Rx on 161.675.
At the land end the frequencies are reversed Rx 157.075 - Tx 161.675.

SHIP TX ---- 157.075 ---- LAND RX
LAND TX ---- 161.675 ---- SHIP RX

These channels are used to carry telephone conversations ship to shore.

Hope this helps,

Regards, Bob

Thank you all for your tips.
Bob / Audrey solution is working - shifting through both frequencies lets me hear both ship and land. Not practical, but good enough .
Julian - I really don't need nor intend to transmit on any of those channels. But my work is port related so having the ability to hear them sometimes helps, when other systems fail.
Now I only need to find out how to reduce a constant noise I hear on some channels.
I'm in an office and have 2 computer (and screens) 1-2 meter away from the radio, 3 more at 3-4 meters distance, not to mention printer, fax machine, etc...
Best regards
Nuno

2725. Min qty for custom logo

Don't know if this helps but my usb cable worked ok 1st time.
Both Baofeng and Chirp software could find and download from the radio.

A couple days ago - with the radio not connected to PC - I programmed a few memories manually.
After this (but maybe not 'because' of this?) neither software could connect to the radio. I even tried manually changing the Com port via windows control panel, without success.
I reset the radio to factory settings, reinstalled baofeng software and ...eureka, PC and radio again talk to each other. Except for Chirp software, which after uninstalling and re-installing still does not connect to radio, whatever Com port I set/manually change.
It shows a "can not find file" kind of error.
I guess I'll stick to baofeng, however basic, software.
Hope this helps anyone.
Nuno

You mention the constant noise that you hear on some channels. My biggest complaint with this radio is intermodulation from other rf sources. I keep my squelch set to 9 (maximum) and as long as I am in a fairly rural area it works well but as soon as I get near homes and businesses there is constant squelch break through with noise. I've mentioned previously that I have it to some extent with my Yaesy VX-7 but I can squelch out the noise if I want to monitor for strong signals. I have to say that I don't seem to get the intermodulation in the 70 cm band, only 2 meter.

Every radio has it's tradeoffs. My Yaesu VX-7 cost over $300 when I bought mine many years ago, the UV-3R was $44 which included shipping. I have a Radio Shack HTX-212 and a HTX-242 and a Yaesu FT-2800M which are all single band radios that I never seem to experience intermodulation. I like all of my radios. The VX-7 is feature packed so I tolerate the intermodulation when it occurs. The UV-3R is cheap and cute and fun to play with but there are many situations that I would be very annoyed trying to use it with the noise issue. You do get what you pay for but in the case of the UV-3R you happen to get a lot for your money but with it's own unique set of issues.

mono band radios will tend to be far tighter with regard to intermod rejection.
This is because they are essentially a band pass filter on receive, so nothing else really gets in except one fairly narrow spectrum of frequencies.
Most dual band radios, unless they are modular in nature, will listen on a vary wide spectrum, thus allowing all sorts of stuff to get into the front end before it is mixed and separated into the bands that you wish to listen to.
Throw in a very sensative receiver, as with the UV3R, and you open everything up for poor intermod rejection.
That is why so many hams especially, claim the older mono band HT's and mobiles were far better at getting rid of intermod...they were. The newer radios that have wide band receivers just grab everything and deal with it at another stage in the circutry. It's not really how much you pay for a radio anymore. It's more that if you want a dual band, tri-band or quad band radio with a wide spectrum receiver, your going to have to deal with intermod.
It is a little easier when listening to repeaters with tone on the output frequency, so you can lock out most of the noise...but when listening to simplex frequencies, or to repeaters that don't have a tone on the output, your going to get noise.

You mention the constant noise that you hear on some channels. My biggest complaint with this radio is intermodulation from other rf sources. I keep my squelch set to 9 (maximum) and as long as I am in a fairly rural area it works well but as soon as I get near homes and businesses there is constant squelch break through with noise. I've mentioned previously that I have it to some extent with my Yaesy VX-7 but I can squelch out the noise if I want to monitor for strong signals. I have to say that I don't seem to get the intermodulation in the 70 cm band, only 2 meter.

Thank you all for your tips.
Bob / Audrey solution is working - shifting through both frequencies lets me hear both ship and land. Not practical, but good enough .
Julian - I really don't need nor intend to transmit on any of those channels. But my work is port related so having the ability to hear them sometimes helps, when other systems fail.
Now I only need to find out how to reduce a constant noise I hear on some channels.
I'm in an office and have 2 computer (and screens) 1-2 meter away from the radio, 3 more at 3-4 meters distance, not to mention printer, fax machine, etc...
Best regards
Nuno

just curious now...with a less than 4MHZ spread between tx and RX, how do the ships, and land stations deal with desencing issues? Do most ships and land stations run cans and diplexers set up for specific frequency pairs like that? or do they tend to use separate antennas spaced far apart to minimize desencing?
If they run full duplex for phone patch purposes, I would imagine they would want to minimize receiver desencing being only 4MHZ away from the tx freq.

Nuno,

These frequencies do not work like a repeater which carries one-way (simplex)speech.

Communications between ship and shore is both way - each end is receiving and transmitting at the same time.

On the frequency pair you have used the ship is set to Tx on 157.075 and Rx on 161.675.
At the land end the frequencies are reversed Rx 157.075 - Tx 161.675.

SHIP TX ---- 157.075 ---- LAND RX
LAND TX ---- 161.675 ---- SHIP RX

These channels are used to carry telephone conversations ship to shore.

Hope this helps,

Regards, Bob

2734. Can't set VFO step size for UHF on Mark II: radio always uses VHF step

Yahoo group: UV-3R (2011)
Date: 2011-10-13 18:33:05 UTC
From: lukestein2002
Topic: 2687 Message: 2734

Dear Darvell,

(I am changing the sujbect of this thread to be more appropriate)

I am also having this issue on my Mark II (which arrived yesterday). I also don't understand KK4DBR Ron's followup question
"Do you have the Frequency Range set to V/UHF+ rather than VHF or UHF?"

Any hints, anyone? It seems that step size is the only menu setting that always uses the VHF setting; the others can successfully be set separately.

Cheers,
Luke

If you want the nitty gritty about marine radio go over to the Yaesu Fox Tango site. http://foxtango.org/foxtango001.htm The moderator, Carol Maher, is a well seasoned communications officer riding the high seas. In fact she is close to retiring and sometimes she is hard to get a reply from when she is at sea. Carol handles all of the radio communications and the hardware maintenance whatever ship that she is assigned to.

Have you set the right COM port on your software?
On windows, go to ' control panel' / 'system' / 'device manager' then look up your Com port (e.g. COM5)

You should set the same COM port on your software.

only if the repeater freq has tone on the output, not all do.
Especially in smaller towns or rural areas where there isn't allot of noise and intermod...
Even in high intermod areas, a properly set up repeater doesn't really need tone on input or output...so allot of the repeater ops don't bother.

even then, you still have to deal with it since $400 radios have that oober wide receiver that collects everything from DC to daylight and crams it into the front end of the radio.

only if the repeater freq has tone on the output, not all do.
Especially in smaller towns or rural areas where there isn't allot of noise and intermod...
Even in high intermod areas, a properly set up repeater doesn't really need tone on input or output...so allot of the repeater ops don't bother.

This will probably have been answered already but just in case .....

A marine channel with such a frequency pair is intended for repeater operation. The convention with repeater frequency allocation is to assign the transmit and receive frequencies with respect to the repeater itself, not the remote user. Hence, the Rx frequency is actually the repeater's own receive frequency. You therefore need to tune your receiver to the repeater's transmit frequency. At the moment, you are only monitoring the repeater's input, not its output. Listen on 157.075

I think Ron's question relates to the Mk1, where it was a choice on the
PC software. It isn't on the Mk2's software.

Nuno,

Land Station _Ship at Sea (or tied up to wharf)_
Tx 157.075 Rx 161.675
Rx 161.675 Tx 157.075

One of these days, I'm going to try to meet a local ham I met on
HamRadioHelpGroup. He's uses a repeater on the far north side of town
but works in the very south, near where I live and work. I can't hit his
repeater with my UV-3R, so, I'm going to listen on the repeater "input"
and transmit on its "output", so he can hear me and I can hear him.

Does this make more sense, now?

2756. Re: [UV-3R] vhf marine channel 81

Yahoo group: UV-3R (2011)
Date: 2011-10-13 23:31:14 UTC
From: Bill Maxwell
Topic: 2713 Message: 2756

Answering my own post. I see later replies indicate that this is not a repeater pair, as such but a genuine full duplex link. Historically that is likely the case but I suspect these days, repeaters may have taken over in many port-ship situations, as well as ship-ship. I know that locally, here in Tasmania, Australia, the marine channel is a full repeater.

I am sorry I called Ron's attention for the use of caps, via a public message. It Was rude of me and I apologize for that.
It Was also off-topic. Sorry about that Too.

As for the marine channel topic itself, I Really would not have this doubt if I didn't get the little radio, so... And I'll use it in these marine frequencies mostly.

Nevertheless, the topic has received a lot of input from diferent people, so I guess it does have some interest.

(just for curiosity, check the UV-3R Google group and see what they are discussing these days...)

Dear Darvell,

(I am changing the sujbect of this thread to be more appropriate)

I am also having this issue on my Mark II (which arrived yesterday). I also don't understand KK4DBR Ron's followup question
"Do you have the Frequency Range set to V/UHF+ rather than VHF or UHF?"

Any hints, anyone? It seems that step size is the only menu setting that always uses the VHF setting; the others can successfully be set separately.

Cheers,
Luke

I have discovered that the baofeng preferred the phisical port of the computer. I have one port (com1) that coming directly from the mainboard and six additional port by attached PCI device. Baofeng Sw and also Chirp working ONLY into the com1(CPU port). All my other SW(for different applications) connected to com3-com8 working perfectly with pci device. I have also measured the level of voltage delivered from PCI device. These are too low in order to provide enough supply voltage to the programming device. This could be the drawback.

I don't have my Mark 2 with me at the moment.

But I thought that the step size was a GLOBAL setting.

You set it, and it use it for both bands regardless.

I think it offers a step size setting on both bands, but it always defaulted to the other.

Just checked this out.

Whatever you set as a frequency step on the VHF band on the lower
half of the display effect BOTH bands regardless.

I had the same issue, and find solution. Switch to 2 m band (press U/V button), that change frequency step (menu -> 09 Step -> U/V -> 6.25kHz -> U/V -> menu), that switch to 70 cm band back (U/V). I do not known why, but it works

Nope. Try it on your Mark I. You have two settings. One step size for UHF and one for VHF.

Even so, if setting it while in the 440 mode, it SHOULD do something, right?
It doesn't. You can be in 440 mode, go into the menu, change the step size, save it, exit, and then re-enter the menu, and it has not changed.

Do the same thing in 2m mode and it DOES change.

That is correct, Andy. That is NOT the case for the Mark I. Each band has
it's own setting. Now trying changing the step setting while in UHF mode.
That's where it gets annoying.

it's supposed to be half a watt isn't it?
When I switch from low to high on VHF, it seems to be consistent with a doubling of my signal, which would indicate a quadrupling of power, which would tell me that the output is going from half a watt, to two watts as per spec?
the actual output will vary somewhat...probably .3/.7 instead of precisely .5W.

stick a tripple 5/8's on a 70FT tower, and use a 30W brick and you'll have no trouble :)

From: Laurie
Topic: 2771 Message: 2779

Interesting, I wonder how consistent the low power is between individual examples.
I've just measured my UV-200 using a Marconi 2955 test set and get somewhat different results.

Frequency Low High

144.000 168mW 1.48W
145.000 160mW 1.50W
146.000 174mW 1.48W
148.000 254mW 1.42W
150.000 350mW 1.33W
155.000 500mW 1.14W
160.000 600mW 1.18W
430.000 760mW 1.20W
440.000 740mW 1.21W
450.000 890mW 1.42W
455.000 990mW 1.45W
460.000 990mW 1.37W
465.000 930mW 1.21W

Note an extra measurement at 430MHz compared to N9EWO's table.
Battery volts 3.6V (It gives less power when on external DC)

Thanks Laurie - yes interesting. And I have read elsewhere that some have found they were getting 2.4W out on both 2m and 70cms..... (I was hoping my UV3R might do that.... will have to check sometime!).

I wonder if there could be a significant difference with your outputs with a fully charged battery at 4.1v.....

2781. Re: Power Output On Low Power

Yahoo group: UV-3R (2011)
Date: 2011-10-15 15:49:30 UTC
From: andyfoad@rocketmail.com
Topic: 2771 Message: 2781

The variations seen are because of various reasons.

LPF filter mods, type of LPF filter mod, frequency and accuracy
of test equipment.

In my experience not many amateur power meters work too well below
5 watts.

Looking at various bits of info here, the *typical* results are:

60mw low power 2m
1.9 watts high power 2m

1w low power UHF
2w high power UHF.

There's quite a bit of variation if you go out of band.

VHF low power can be 600mw at around 157Mhz on a modded sample.
VHF high power could be 2.5 watts at 157Mhz.

Most users don't waste time about this, instead efforts are best made
in using the most effective antennas ;-)

sure there is, with high quality test equipment.
granted, not with your average watt meter, or even average scope, but some of the really high end commercial stuff is very very accurate.
One of our local hams has some test gear that ranges up into the 20 to 30 thousand dollar range for one unit.

Thanks everyone for the excellent responses. Now I see why I can't measure the power output on VHF at the low power setting. I was using an inexpensive power meter that has a 15 watt scale.

I don't have a 1 watt element for my Bird meter.

2785. Re: Power Output On Low Power

Yahoo group: UV-3R (2011)
Date: 2011-10-16 08:55:06 UTC
From: andyfoad@rocketmail.com
Topic: 2771 Message: 2785

I have an old Diamond (a real one, not a Chinese fake) that works superbly up to 2m in the 50mw area.

I also have a home made probe that can do a few milliwatts but only accurate to about 100Mhz.

Everything else on the amateur market is pretty poor at low power levels, and several other of my VHF/UHF power meters cannot really be relied upon with low power levels.

So yes, accuratly measuring stuff below 5 watts, and certainly milliwatts could easily prove misleading for the amateur.

Thankfully this group has proved to be one of the most amazingly collaborative efforts I've ever seen on the internet,so the answers can usually be gotten ;-)

Enjoy your Baofeng.

OK, results with a fully charged battery at 4.1V measured using the same
Marconi 2955 test set. Radio is a UV-200 as delivered, no mods.

Frequency Low High

144.000 170mW 2.01W
145.000 168mW 2.03W
146.000 174mW 2.03W
148.000 256mW 1.93W
150.000 380mW 1.79W
155.000 610mW 1.50W
160.000 730mW 1.49W
430.000 950mW 1.68W
440.000 930mW 1.68W
450.000 1.10W 1.89W
455.000 1.22W 1.94W
460.000 1.35W 1.87W
465.000 1.24W 1.78W

2788. Re: [UV-3R] Power Output On Low Power

Yahoo group: UV-3R (2011)
Date: 2011-10-16 11:52:21 UTC
From: Joe
Topic: 2771 Message: 2788

I saw about 20 milliwatts on my service monitor at VHF low power, UHF low power output was higher.

What concerns me more is that the radio was 1.25KHz off frequency on VHF. I have to look into this further and check the calibration of my service monitor just to be sure. I'll put in on another SM and see if I get the same thing.

BTW, even a 1 watt Bird slug would not be very accurate. The Bird slugs are only guaranteed to be accurate in the top 1/3 of the range. Also, the accuracy is 5% of top scale anywhere on the meter. So, a 1 watt slug can be off 50mw anywhere on the meter. It's in the manual.

For those of you interested, see:
<http://www.dxstore.com/download/Bird_43_Series_Manual.pdf>
page 58

From: PaulG
Topic: 2790 Message: 2790

Sitting with radio in back pocket will break the display!
Don't ask how I know...

Does anybody know the spec's for the display?

Characters across x down ?

Will probably just order another one.

Maybe you can turn this radio into a packet interface. I got myself a few 4-pin connectors and started on one, but then got sidetracked by other projects. Connect it to PC via soundcard, employ magic to get it on the right frequency, and you can listen to APRS or other packet modes.

I have a plan of setting one of these up as an APRS input.

2792. UV-3R DTMF generator

Yahoo group: UV-3R (2011)
Date: 2011-10-17 09:15:34 UTC
From: mikewogden
Topic: 2792 Message: 2792

Can anyone recommend a suitable DTMF generator to enable the UV-3R for Echolink.

So far I've tried two `free' DTMF apps for my Ipod Touch but with no luck.

Can anyone recommend a paid app that they know works. I don't want to waste numerous hours and $1 bills (69p in the UK) trying each paid app.

Regards

Topic: 2790 Message: 2793

Sounds like a good idea. Even if you can't read the display you could probably program it up via computer to one frequency 144.39 and hook it up to a TinyTracker. You'd have a really small APRS station.

At the cost of a new one I don't think I would try to fix it. This is a good time to buy the latest and greatest radio available.

I use the keypad on my nokia and just put the phone's speaker up to the mike hole on the UV3r...I then just key the radio and punch in whatever digits I need...of course, you can't get the ABC and D keys from a phone keypad or a DTMF generator.
Why buy an app? you've got a perfectly good DTMF generator right there on the phone.
It's too bad they didn't at least allow for DTMF storage on the UV3R.
Allot of commercial radios at least have this, and you can set buttons on the radio to send the stored DTMF tones when you are transmitting.

It won't help you on portable, but the new version of fldigi supports DTMF. So you can run that on about any PC. You can also setup macros, which is nice for entering some of the longer dtmf commands.

If I had some money, I would consider setting up a bounty to recreate an fldigi like program in Android. At the very least, it would be nice to fill out one of the flmsg forms and "acoustically couple" the phone to your radio's microphone to send them.

From: s4_wombat
Topic: 2257 Message: 2801

Hi Roby,

with the Mark 2 UV3R, you can change the software (1.08 or above) to allow the entry of alpha tags (names) against the frequency.

Look in C:\Program Files\UV3R\settings.ini and change the following line:

name=0

to

name=1

When you reload the UV3R software you can enter the name of the channel (4 characters only) in the last column. The bad news is that it's not yet clear how we should enable the channel name (alpha tag) display on the radio itself; does anyone have any ideas?

I did not have the UV-3R software. I downloaded it from 409 few minutes ago to verify the info and to add it to the FAQ: I got 1.09.

Editing the .ini file does work:
- close the software
- edit and save the file
- reopen the software

Not having a programming cable I cannot tell if this breaks the up/download to the radio or not. If someone confirms I will consolidate the info in the FAQ (working copy).

Hi Paolo,

thanks for the reference to 409 shop.

With version 1.09 it is still possible to enable the name entry column by editing settings.ini but there is no instruction on how to enable name display on the Mark 2 radio. Does anyone know how to do this?

Well I can assure your I have followed the instructions implicitly and the ame field still doesn't allow any entry. It is still greyed out.

Here is the .ini file I now have:

[setup]
com=1
searchcom=1
name=1

language=english

[ModelInfo]

Freq0=[136-174/400-470]
data0=6013401700400047

Freq1=[144-146/430-440]
data1=4014601400430044

Freq2=[144-148/430-450]
data2=4014801400430045

Any suggestions?

John

From: john
Topic: 2257 Message: 2808

I have discovered what the problem is/was.

The program looks for the .ini file in the UV3R folder. I had called my folder UV3R Mark 2, so presumably it couldn't find my edited .ini file and used default values. Why did I use a different folder name? Because I have both a Mark 1 and a Mark 2.

Needless to say the program now works!

In reading your link on your settings for the UV3R, I noticed that you have "Priority Channel" checked, and Priority Channel "Off". I cannot find an "OFF" for my Priority channel. It is only 1 thru 91. I have been trying to get it from scanning the priority channel but it still does, even if I have unchecked the "Priority Channel" box.

2810. Dual Watch/Priority

Yahoo group: UV-3R (2011)
Date: 2011-10-19 18:27:12 UTC
From: JOHN
Topic: 2810 Message: 2810

I cannot get my radio to stop the "Dual Watch" feature. It still scans Channel 1 even with dual watch off. Also on the program for 'Priority Channel" there is no "off", only channel 1-91 to select. I have "Priority Channel" uncheck, yet the radio still keeps switch back and forth to channel 1. How do I stop this?

Hello,

After two days of using my UV-3R (markII) when I was setting the frequency shift for the lower line I noticed that the arrow stopped working.
Now I have a device on which the U/V button does not work anymore.

Does someone have this experience?

regards,

corvus

I haven't had any of the 3 function buttons on the front of the radio stop working, but I do find they can be a bit sticky sometimes...with the menu and V/U button, I usually have to poke it two or three times to get it to activate.
I guess a fix would be to pull the radio apart and reseat the rubber membrane, or possibly fix the PCB contact for that button.
Try pressing harder on the button or wiggling it a bit while it is depressed and see if that makes it work.

regards
Colin

I would bet that the little metal disc is off center or is stuck down under the keypad.

If you still feel a click when you push it, then it may be off center. If no click, then its stuck down.

Its not a membrane like newer radios, they are what I would call snap switches.

2814. Bricking your radio

Yahoo group: UV-3R (2011)
Date: 2011-10-20 01:21:22 UTC
From: BD
Topic: 2814 Message: 2814

Maybe this has been covered, but I couldn't find it in the archives this afternoon, so I thought it might be worth mentioning. I have both a Mk I and Mk II radio and was using CHIRP to import a spreadsheet of local frequencies of interest to both. What doesn't seem explicit in the archives is that either CHIRP or the UV3 programs adapt to the _last_ radio model they uploaded from, so cross fertilization is a tricky affair. If you upload a channel list from one generation and try to download it to the other, you will get the dreaded DDD.D25 display. The only way I found to go from one generation radio to the other is to use CHIRP and save the data uploaded from the radio to a .csv file, then, on the second radio, first upload its data and replace it with the .csv file before downloading. This keeps the model dependent data and only changes the frequencies. Hope that helps a couple of folks.

I too would like to know how to switch this "feature" off.
Actually I don't recall how I activated the priority scan, I see no mention of it anywhere. I suppose I could try and reprogram it or do a reset but I should not have to. Or is this one of those "features" that wasn't planned? LOL

In reallity I don't mind the ch.1 priority scan so much, as the way I have my radio programed channel 1 is the one I like to monitor most anyway so no biggie. I don't want to loose this ability altogeter, but would like to know how to turn it off and back on at will with having to resort to reprograming or a reset.

should be a button on the left side of the radio marked L/R.
Keep holdin' 'er down until the FM radio shuts back off.
On mine the button is not red but its brown just like the PTT button is.
Try that

On my UV3-R the button is on the left side...the lowest button. It also turns on/off the light on top of the rig. You just have to hold a certain pressure on this button and FM will go on or off (at least on my HT)

2823. programming cable issue

Yahoo group: UV-3R (2011)
Date: 2011-10-20 18:33:50 UTC
From: pa3bya@amsat.org
Topic: 2823 Message: 2823

I got two shining BF-U3's and a UV-3R in the mailbox yesterday, along with a programming cable.
Unfortunately the programming does not work, I got a 'cannot connect to radio' error from both the BF-U3 as the UV-3R software.

The driver shows up properly, so I tested the cable by connecting ring 2 (RX) to the tip (TX) and typed characters from a serial terminal emulator. No characters are echoed, I only got a linefeed for each character typed. My conclusion now is that the cable is broken.

Any other idea's?

thanks,
Gerrit.

Date: 2011-10-20 18:48:43 UTC
From: Lee - N9LO
Topic: 2825 Message: 2825

All my programming used to work fine. I wanted to add 1 frequency so I opened the software, connected the cable to the turned off radio, plugged the cable in to the USB port on my XP netbook, checked what com port it took and set the software. I cannot upload or download. Cannot connect to radio error. I reset the radio so all the frequencies I had are gone. I re-installed the driver from the files section, and re-installed the software from the files section. I next tried it all from my desktop PC that worked before. Is there any way to tell if it is the cable or the radio causing this?

2827. Re: [UV-3R] Re: u/v button not responding! Is there a fix?

Yahoo group: UV-3R (2011)
Date: 2011-10-20 21:12:43 UTC
From: colin McDonald
Topic: 2811 Message: 2827

it's very easy to open the UV3R.
Remove the battery cover, then remove the battery. There are two small phillips head screws on each side of the battery compartment at the base of the small heat sink fins.
Remove these screws, being careful not to strip the heads as they are, shockingly, cheaper cost effective metal. Then, remove the top knob by taking out the phillips head screw that secures it to the pot shaft. Take off the antenna of course. Now, you can slide the whole radio assembly down and out of the plastic casing. There are no speaker wires, which is very nice...instead, there are two spring contacts that jut from the PCB that will touch the contacts on the back of the speaker, which is glued into the plastic casing.
You will now have access to the four rubberized buttons on the front pannel. The buttons will come out, as will the rubber cap that goes over the microphone element.
Check the metal nub on the U/V button to make sure it looks like the other nubs...then try reseating everything.
Make sure you put the microphone element cap on the element first before sliding things back together...I found that if you leave the rubber cap in the plastic casing, that the mike element tends to be a little sticky to reseat.
You might also consider reeming out the microphone hole on the front of the radio. This helps with audio loudness and overall tone since it will allow more audio to get to the microphone element.
The problem with the UV3R is that the pin hole is quite a bit off center of the element itself..and it's very small. Also, the even smaller pin hole in the rubber cap constricts audio into the element.
Be extra careful when putting the two screws back into the chassis...they go into plastic and can cross thread and or strip the threads very easily if over tightened.

Hope that helps.

Regards
Colin

I took one back to local store because the FM button would not work when I wanted it to. It would not always click when pushed in. I was pushing so hard you could see my finger nail print in the button. One out of 5 to 10 tries would turn the FM off or on. I bought a few so checked the buttons on all. That was the only one with problems.

Do I have to change the vfo or can I select channel 1 or 2 etc? When I push the u/v button it only changes between UHF/VHF turning the dial button only changes the vfo frequency. Is this different than other models?

Mine is not the Mark II, but...
Instead of pressing the u/v Key, press and hold it.
All buttons have both these options:
"Simple press" and "press and hold"

Somewhere there is uv3r "cheat sheet", maybe on brickalore.com (??). I found it very useful when starting with this radio.

Did you go to "Comm Port" and select a Com port? Under the "settings" menu? I had to try a different USB port than what I thought it should have been to get mine to work. Now it work perfectly on "Com Port 5" not #3 where I thought it was loaded.

2842. new plastic cases from wouxun.us for the UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-10-22 03:47:03 UTC
From: Randy Bateman
Topic: 2842 Message: 2842

I haven't seen this discuss, but I may have missed it in my search. If so, sorry for the repeat.

I have wanted either a yellow or Blue cased radio ever since RIGHT after I bought my black one. I really like a black radio also, but part of me wanted something no one else had in the colors.

So I jumped on a couple of cases now offered by Wouxun.us in both yellow and blue.

They came yesterday and this morning I put the radio in the blue one.

My comment here is that these cases come with a new plastic screen cover, new rubber front buttons, new rubber PTT side buttons, a new Knob on top and the speaker is part of the case, so a new one of those also!

The first thing I've seen go bad on radios like this is the screen gets scratched, and the lettering rubs off and/or tears, and these $6 kits has all those spare parts. Plus my UV-3R can be any color I wanted!

The only other thing I would like find now would be spare rubber side covers for the Mic/SP/ear and Power plugs. Those are first failure items also!

I suspect other shops may have these cases also, but I haven't seen them.

Randy, AC7DM

2843. Spk/Mic Audio

Yahoo group: UV-3R (2011)
Date: 2011-10-22 06:52:19 UTC
From: nr7j
Topic: 2843 Message: 2843

I tried wiring up an external speaker to the UV-3R, the plug going into the radio has 4pins and 3rings. I solder the white wire (spk+) to the tip and the black (spk-) to the very last (post) pin on the plug but NO AUDIO is coming out from the speaker.
I then tried rewiring a motorola clear earbud spk/mic. The audio coming from the radio is very very low and when I press PTT it will not key-up the radio. What am I doing wrong ?

The audio output at the 4-pin plug is intended for a headphone, it sees only one pin of the LM4890 push-pull-output AND is additionally attentuated by a 220R resistor to ground. You will therefore have not more power available than a few dozen mW.

If you still want to operate an ordinary speaker there, you should treat the signal as a line-out and use a separate AF amplifier to bring it up to speaker level.

2853. U-VFO vs. V-VFO vs Memory Mode

Yahoo group: UV-3R (2011)
Date: 2011-10-23 14:55:55 UTC
From: mparrott_30360
Topic: 2853 Message: 2853

I just received my UV-3R Mk II yesterday. I have imported memories from another radio using the CHIRP software.

The indicator points to the top freq. If I momentarily push the U/V button the indicator switches to the bottom freq. If I push and hold the U/V button the top freq switches to memory mode.

The indicator points to the bottom freq. If I momentarily push the U/V button the indicator switches to the top freq. If I push and hold the U/V button the TOP freq switches to memory mode (if in VFO mode) or VFO mode (if in memory mode).

So I assume that memory mode is only valid for the top freq. and the bottom can only be used in VFO mode, like the nat'l calling freq or some other simplex freq.

So far I am impressed with this $50 radio. I have had no problems with the programming cable or the software. Although I cannot get the 4 character name for memories to show on the display.

yep, heavily modified case, cuz the heatsync is barely enough to cool the radio on 2W output.
So you'd have to install a new heatsync as well as a bigger, very customized case.
By the time you do that,you can buy a Wouxun that puts out 5W.
The UV3R is what it is, and power increase mods are just not feesible.
Regards
Colin

When you're typing "heatsync" is that the same as "heat sink" as in the provisions for cooling it?

Not sure if I follow this one

say heatsync and heat sink outloud...do they sound the same?
what is hard to follow?
The "heat sink" in the UV3R is not large enough to dissipate heat caused by a transistor putting out more than about 2W for short periods of time. Yes, the UV3R's PA can be modified to put out 6W, but everything would fry rather quickly because there wouldn't be enough heat taken away from the components by the small stock heat sink on the radio. So, modify away, but don't expect the radio to function very long after you do this and transmit for more than a few seconds.
Any 5W output HT will have a heat sink about twice the size of the one on the UV3R...that is why the physical size of the higher power HT's is bigger.

As has been said before, it is what it is.

According to the specs of the output device, max power at 465MHz and 4.8 volts is 3.3 Watts. 50mW drive required. At 520MHz and 6 volts power out is 6 Watts. 316mW drive required.
With the less than 4 volts from the battery in normal operation then the 2 Watts available makes sense and keeps the overall efficiency reasonable too.
Want more power then buy a different radio is the practical answer. Unfortunately it will be a bit bigger. Small radio + small battery means small power. I find 2 Watts is plenty for my use.

say heatsync and heat sink outloud...do they sound the same?
what is hard to follow?
The "heat sink" in the UV3R is not large enough to dissipate heat caused by a transistor putting out more than about 2W for short periods of time. Yes, the UV3R's PA can be modified to put out 6W, but everything would fry rather quickly because there wouldn't be enough heat taken away from the components by the small stock heat sink on the radio. So, modify away, but don't expect the radio to function very long after you do this and transmit for more than a few seconds.
Any 5W output HT will have a heat sink about twice the size of the one on the UV3R...that is why the physical size of the higher power HT's is bigger.

As has been said before, it is what it is.

When you're typing "heatsync" is that the same as "heat sink" as in the provisions for cooling it?

Not sure if I follow this one

From: DavidN
Topic: 2869 Message: 2869

Grrrrr.... Just switched on my Mk.I set to find that all memories had been reset to 400MHz and all Menu items reset to default. Also, VHF and UHF freqs. reset to default, so it's a total reset. The battery was fully charged.

No-one in the house can get to the rig to do a factory reset themselves, but I did hold the ON /OFF button in til the rig came on so wonder if that was it..... (I wasn't holding in any other buttons) grrrrr.

Had the rig for two months with no problems until this.... Anyone else had this experience?

.d. G4TUP.
P.S. and I was just about to do some satellite stuff which was annoying.

2870. Re: No! My UV-3R just completely reset itself!

I've once had this happen.

Probably a sticky key when the rig was turned on and it did a reset.

The push buttons/pads are not the most reliable ;-)

At least having a programming cable to hand means you can zip the
memories in quickly.

The original UV3R group had already established itself with all users before the Mk2 group was started. So naturally everyone used this group for all flavours of UV3R, and the other group didn't get that many postings.

Hi,

The subject has been up - but without an answer.
I have a number og both Mark I and Mark II -
I use them in the car club I'm in - so they all have the same configuration and with the help of CHIRP I have translated the configuration from Mark I to the Mark II ..... but!

We only use the PMR (European pendant to FRS) band in the 446Mhz area.
Is there a way of getting rid of the VHF settings? All it takes on the Mark II is a press on the U/V and most of the users are lost and without radio contact - the could never happen on the Mark I radio.

Best regards
Michael Williams

Hi fella's,

Thank you for yor prompt reply's -
not answers - just reply's.

Sorry for pointing this out - but I have bought the darn units -
First the Mark I - where size and quality looked like the right stuff after testing 5 pieces - then after I bought a larger quantity I realized that a Mark II had replaced the original one.

So the question remains - how do I disable the VHF as I could on the Mark I? Remember - in other scenarios these radios will be using the VHF - and in those cases I want them to only show that and not the UHF bands.

Best regards
Michael Williams

Well... I see two options to resolve your issue:

1. educate the operators of the radio on how to make sure they are using the correct memory position. (It's not that hard, if they can operate a car this should be no problem for them...)

2. use this group to find owners of the older model and offer them a trade up to MarkII radios for the cost of shipping.

Couldn't you open them up and put a small piece of plastic between the push button metal and the switch to stop it activating? Or remove the switch completely? A bind if you've got a load, I know, but otherwise, with software not possible....

I think it was answered by Nuno Xavier pretty clearly.

Use the menu lock function: Press and hold the menu button until the little lock symbol shows on the screen (top row, center).

The users can power on/off and PTT, but can't change the band or the U/V selected.

Mike - N4MEP

Yes, and add a sticker with a couple instructions to the back of the radio, if you feel necessary...

From: - -
Topic: 2878 Message: 2892

Well you could sell those ALL and get the NKT-R3 radios that are monoband UHF. Love 'em or leave 'em.

http://www.ebay.com/itm/NKT-R3-UHF-400-470MHz-Mini-2-Way-Ham-Radio-Accessories-/270758751064?pt=2_Way_Radios_FRS&hash=item3f0a7aab58

Then you'd be stuck with UHF only.
Where I am they have a lovely state wide / region wide UHF state linked system and its also linked to IRLP

2893. Running 2 watts continous

Yahoo group: UV-3R (2011)
Date: 2011-10-28 00:13:00 UTC
From: jerry
Topic: 2893 Message: 2893

If I connect two of these together for a cross band repeater for a local event Or just to get out of a metal building, I will have to run 2 watts as low power is unreliable. Realizing the units are rated at 50% duty cycle on high power, the question is:

How well is the metal plate behind the battery attached to the finals?

If well attached heat conductive wise, I would use an external power supply for the radios and place a small fan on the metal plate. Than the radios could be connected thru the mike/speaker/PTT jacks and operate in vox mode.

Comments? - Jerry

Interesting question Jerry.

> How well is the metal plate behind the battery attached to the finals?

Having disassembled one unit down to each part, holding the PCB in my
hands, I can tell you that the finals are hard-pressed against the
aluminum body through a pad of thermal conductive spongy material. You
can see them in this picture in the photos section:
<http://groups.yahoo.com/group/UV-3R/photos/album/1332716473/pic/396513126/view>

> If well attached heat conductive wise, I would use an external power supply for the

> jacks and operate in vox mode.

I will not get into the details of interconnecting the two devices for
a repeater, since I'm not an expert. But if I were to do something
similar I would extract the transmitting UV-3R from the plastic case,
increase the aluminum surface and/or blow a constant air flow on it.

Anyone interested in using HT's as the basis for a repeater might take a look at this site:

http://www.3rd-st.com/micor/micormod.htm

These guys took a couple of HT's and used them to make a Micor repeater frequency agile. Essentially, the portables were used to replace the receiver and exciter in the Micor If you drill down, you will see how they handled the heat sink issue.

Another interesting part of the article is how they put the helical filter from the original Micor receiver in front of the HT receiver to improve selectivity. This would clearly benefit the UV-3R. Micor receiver boards are frequently available quite cheaply and the helical filter is easy to remove.

DO THEY HAVE A LICENSE TO APERATE THESE RADIOS

In a message dated 10/27/2011 10:25:34 A.M. SA Western Standard Time,
lmedcalf@... writes:

Well... I see two options to resolve your issue:

1. educate the operators of the radio on how to make sure they are using
the correct memory position. (It's not that hard, if they can operate a car
this should be no problem for them...)

2. use this group to find owners of the older model and offer them a trade
up to MarkII radios for the cost of shipping.

On Thu, Oct 27, 2011 at 9:14 AM, williams_nest <_williamsnestdk@..._
(mailto:williamsnestdk@...) > wrote:

Hi fella's,

Thank you for yor prompt reply's -
not answers - just reply's.

Sorry for pointing this out - but I have bought the darn units -
First the Mark I - where size and quality looked like the right stuff
after testing 5 pieces - then after I bought a larger quantity I realized that
a Mark II had replaced the original one.

So the question remains - how do I disable the VHF as I could on the Mark
I? Remember - in other scenarios these radios will be using the VHF - and
in those cases I want them to only show that and not the UHF bands.

Best regards
Michael Williams

2904. MTC uv-x4 (uv-3r) / Pryme rd-9 or rd-98 question

Yahoo group: UV-3R (2011)
Date: 2011-10-30 02:10:56 UTC
From: ke5ycj
Topic: 2904 Message: 2904

I bought 3 of the uv-x4 from maintradingcompany.com with warranty, along with a couple of uv-3r color cases from Wouxun.us The new cases are a tight fit, as they should be. Installation requires removing 3 screws.
http://www.flickr.com/photos/lpfamily/sets/72157627882876353/
<http://www.flickr.com/photos/lpfamily/sets/72157627882876353/>
I get very good performance hitting distant repeaters on 2w with a magmount antenna, but have trouble with copy on close repeaters with the stock rubber duck. 440 simplex works well. I am considering the Pryme rd-9 or rd-98 as a replacement antenna. Does anyone have experience with either antenna on the uv-3r/uv-x4?

2905. RE: [UV-3R] MTC uv-x4 (uv-3r) / Pryme rd-9 or rd-98 question

Topic: 2904 Message: 2905

I have used the used the 98 with good success...I have checkedc the SWR on it and it seems to be better on 440 but still good....very good receive....flexibility is great...I'm not a fan of the SMA one and use the BNC. I also use a similar SMA version of 7 inch whip with good results as well...mine says WEX on it but I have see other names.

As seen on the aforementioned website - not sure I agree with the last line. None of the Mk2's I've seen appear ot be cured. I still have to mod them before passing them on to purchasers.

A Review of the Handheld VHF/UHF Transceiver
The amateur radio rig UV-3R is manufactured in China. Its heart is the one-chip transceiver RDA1846 from RDA Microelectronics in Shanghai which is a software-defined radio (SDR) for 136-174 MHz (VHF) and 400-470 MHz (UHF). Two PAs, one for VHF and one for UHF, produce a transmit power of 2 W. A 1-chip FM radio for 87.5-108 MHz is also built into the rig.

The receiver does not use any ceramic or crystal filter. It is an IQ direct-conversion receiver where a DSP (digital signal processor) is responsible for selectivity. Problems of the first generation, like transmission of harmonic signals, have been solved (as of September 2011).

Hi Lance. Can you just tell us (or anyone who has one) about the camo case, and if the camo is painted onto the plastic or is it moulded within the plastic. From one of the useful photos you posted it looks, but not certain, like it's moulded within the plastic. The answer to this would go to fill a hole in the FAQ.

Thanks, David. G4TUP.

I have the uv3r camo version.
The inside of the battery cover is completely Green, therefor it seems the camo is painted on the plastic.
I can see one olive green and one Black paint camo patern layers.

I use the RD-98 on all my HTs when I want to get out any distance. I noticed years ago I could reach repeaters on 0.2 watts with the RD-98 that required 2 watts with the antenna that came with the radio. Also see web page http://www.eham.net/reviews/detail/1268 for more comments on this antenna. - Jerry

Hi all,
I was trying to listen to the pager frequency on 153.225mHz
and it would hardly break the squelch (tried various settings)
even when set to 0 I had trouble receiving it I was wondering if the sensitivity is consistent across the band or are there deaf spots
or maybe my antenna's gone duff.
same signal on the wouxun was full scale!

regards..........

What's it like with the squelch open?
Maybe the software defined (DSP) squelch has problems with the pager signal data.
Just a thought.

Topic: 2893 Message: 2923

I found the idea battery charger for repeater operation. One would have to charge the battery at least at the transmit current level. I found the LTC1733 will allow 0.5 to 1.5 amp charge and will start charging when the battery gets below a set voltage. See http://www.linear.com/product/LTC1733 . My problem is the chip is 0.118 by 0.118 by 0.005 inch and has 10 leads. There is no way I can work on something that small. Anyway I can get this mounted to a 14 pin inline chip with 0.1 inch pin spacing? Or something big enough for an old timer to work on??

Also thanks for the HT repeater information. I see I should probably put some bandpass filters in front of the receivers. - Jerry

>
> These guys took a couple of HT's and used them to make a Micor repeater frequency agile. Essentially, the portables were used to replace the receiver and exciter in the Micor If you drill down, you will see how they handled the heat sink issue.
>
> Another interesting part of the article is how they put the helical filter from the original Micor receiver in front of the HT receiver to improve selectivity. This would clearly benefit the UV-3R. Micor receiver boards are frequently available quite cheaply and the helical filter is easy to remove.

2924. [UV-3R] Camo version

Yahoo group: UV-3R (2011)
Date: 2011-10-30 22:53:43 UTC
From: Nuno Xavier
Topic: 2924 Message: 2924

(changed the topic subject for better future reference)

Here are a few photos about the questions asked below -
http://dl.dropbox.com/u/81229/uv3r%20camo%20photos.zip

David, feel free to use these photos. If you want better resolution pics,
let me know. If you need another ones, with a particular detail, also
contact me.

These photos were taken from a UV3R 18 menu options model, bought from
409shop in late September 2011.

As for the question "Do you think the paint is resilient or may
scratch/flake off after some use?":

well, I had a lot of trouble scratching the cover until I could see the
green plastic under the black paint, so my answer is yes, the paint is
quite resilient (see photos) :)

On the photos, you can see both the main plastic cover and the battery
cover are made of green plastic, which was painted with a darker green and
a black paint to form a camouflage pattern. Check the photo with the
cotton-tip, where part of the black paint was removed with alcohol.

It is also visible on the photos some bad painting finishing, as there are
several spots where the black paint was badly removed or is still showing
(check previously mentioned photo).

Nuno

David said, " Do you think the paint is resilient or may scratch/flake off after some use?"

Later tonight I'l post some photos of the radio with the answer to this. I think it will hold ok, but I only have the radio for 2 weeks :)

John said, "It doesn't look painted to me...it looks like 3 colors of plastic molded together...."

Can you open the battery cover and check its inside? Is it one color (green) or do you see those 3 colors?
Also, check the sides of the main plastic. If it is molded plastic, then you shall see those 3 colors instead of continuos light -green line all around .

I remember playing with modelling clay (plasticine, putty ?) as a child, and I believe you wouldn't get this camoflage pattern if mixing 3 diferent clay colors.

Hi Lee. Have a search for a file called YC-2011A.PDF published by Luciano PY2BBS, which I have here. It's quite a complicated circuit for a wallwart!

It does say the output is 5v at 1000mA so as NR7J (name unknown :)) says it is regulated. But the circuitry within the rig prevents the battery from being overcharged....

David G4TUP.
P.S. will try to upload the file to the files section later..... (if not already there).

From: DavidN
Topic: 2924 Message: 2929

Excellent photos Nuno, thanks so much for going to the trouble of taking them, they do show exactly what's being asked!

That basically the camo version is a green shell, overpainted with olive and black paint with gaps between those two to reveal the green shell too, which produces a tri-tone camo.

I'll update the FAQ with the details and the link and then everyone can have a look. As you say, the paint does look quite resilient to attack by man or beast, or even a ham radio operator :)

Thanks again, .d.

No problem, I even found new functions on the photo machine :)

Can you put the photos on the file area and link to them? The server where I put them is provisory.

2933. Re: UV-3R usb cable compatible with WOUXUN KG-UVD1P ?

Yahoo group: UV-3R (2011)
Date: 2011-10-31 14:05:21 UTC
From: john_kb0ne
Topic: 2913 Message: 2933

Hi,
The UV-3R plug is not compatible.... but the polarity and levels are.

I modified my Wouxun USB cable so that it has 2 different plugs on it; a TRRS for the UV-3R and the "Kenwood" like cable for the Wouxun.

Unless you are into messing around with modifying these cables it's probably a lot faster to buy a USB programming cable for not that much $$$ and be done with it.

From: vimproved
Topic: 2895 Message: 2937

Lol wut. What are you guys smoking? The wallwart is a switch mode supply. It supplies 5V with a maximum current of 1A. It does not contain ANY circuitry for controlling the charging of a Li-ion cell. You NEVER charge a Li-ion above 4.2V unless you want some fireworks. Conversely you never discharge it below 3.2V (for a host of other reasoins). The protection circuit in the battery is the last line of defence against 3.2V wrote: > > Hi Lee. Have a search for a file called YC-2011A.PDF published by Luciano > PY2BBS, which I have here. From: Pete Snidal
Topic: 2941 Message: 2941

Hi, all! I'm at this point likely the newest member of the
group. Name is Pete, Callsign is
VE7EKF. I'm having huge fun playing with my new UV-3R, but I have a
slight problem.
I have programmed the thing to work on my local repeaters. 728 and
694, as well as 442.075. Have managed to set memories for both
possible vhf/uhf combinations. However, the only way I can get from
728 to 694 and back and forth again is manually to change the
frequency. How does one call up a memory channel once set, please?
tnx,
ps VE7EKF
PS here's a dandy tip: when you're dialling around in a frequency
range, you can go to steps on the left side of the decimal point by
pressing the F/A button and VOL simultaneously. This will bring up
an "F" icon on the top of the screen, and allow you, for instance, to
go from 147.xx to 148.xx, 149.xx, etc. A lot quicker than going
through the .05Khz steps. I don't imagine I'm the first to discover
this, but I didn't see it anywhere in any of the manuals.
73,
ps

Press and hold the U/V key to enter and/or exit memory channel mode to
VFO mode.

Hello All,

Just had a pair of these little radios arrive today, generally I'm very pleased with them, apart from the intermittent "dropout" on RX of strong signals (explained in another thread its good to know the reason, even if it can't be fixed).

Anyhow, these radios have a 19 function memory with the 19th being PRI on/off. Anyone else seen this or got any idea what it does?

Many thanks and 73,

Dave M0MYA.

From: Steve
Topic: 2948 Message: 2949

Thanks for the post however I doubt your Wouxun is actually functional through that range (although you may get the display to seem to indicate that). If you have indeed done what you claim then your welcome to share your application and insight to the 2000+ members of our Wouxun KG-UVD group at http://groups.yahoo.com/group/Wouxun_KG-UVD1/. None of them have made such a claim.

2950. UV3R range on PMR freqs

Yahoo group: UV-3R (2011)
Date: 2011-11-01 22:33:45 UTC
From: Nuno Xavier
Topic: 2950 Message: 2950

Has any owner of a pair of uv3r tested their range using the 446UHF PMR frequencies?

What was the max distance and how was the overall performance of the Baofeng compared to (other) PMR models?

If no tests, then what can I expect from the uv3r working with one/as a PMR?

I have two pairs (Midland G7 and Oregon Scientific TP391) PMR radios, and am considering selling them and getting another uv3r.

(yeah, I know could have made some tests by now...)
Any ideas?
Thanks
Nuno

FWIW, In the states we have GMRS MURS and FRS so I am not all that familiar with the PMR regs in the EU and elsewhere(I also assume that within the EU there are differences). I am guessing/wondering if there are power restrictions that the UV-3R might violate eg max 1/2 watt and perhaps some other features similar to ours like (no detachable antenna etc). Then again I am also not familiar with regulators zealous enforcements of what ever regulations exist.

2952. Re: [UV-3R] Re: UV3R range on PMR freqs

Yahoo group: UV-3R (2011)
Date: 2011-11-01 23:28:43 UTC
From: Nuno Xavier
Topic: 2950 Message: 2952

I believe PMR use is license free in most EU countries, provided that PMR radios should:

a - use freqs within 446 UHF range
b - no detachable antenna
c - have a maximum transmit power of 0.5 w

Most PMR boxes say they have a range of 3 to 5 km.

knowing the uv3r has 2w transmit power, my questions are:

1 - is how far can they reach, in a hypothetical no obstacles / line of sight situation (using 2 uv3r);

2 - if I use one uv3r (with 2w) and a normal PMR (0.5w), in the same hypothetical situation, what would happen? Would the uv3r send and receive properly at, say 6 or 8 kms, and listen clearly to the PMR while this one would not receive anything but noise?

From: Steve
Topic: 2950 Message: 2953

Ignoring the legal and regulatory issues involved (although one can't really) you ask a question not really with a clear answer. For example, with my UV-3R I have made numerous contacts through orbiting satellites some 400-500 kms in orbit. My signal reached the satellites via "line of site" and rebroadcast them all through a satellite with a little 1/4 wave vertical antenna on it(I was using a handheld log periodic antenna)At the same time I have been operating in a car mobile to mobile through it's attached antenna and covered maybe 3 kms at best. It all depends.....buildings, line of site, hills etc. Sorry not much help.

73,
Steve

2954. Charging mod question

Yahoo group: UV-3R (2011)
Date: 2011-11-02 02:50:51 UTC
From: old_lew
Topic: 2954 Message: 2954

Hello,

I understand that the charger that comes with the UV-3R connects direct with the battery through the radio without a charging circuit. I wonder if I could connect the output from a NP-60 battery charger direct to the stand pins to charge the bat inside the HT? This way I can add a charging circuit to the base just by splicing a few wire and the cost is only 3 bucks.

Thanks,

Lew WD8AQS

I just tried it to remind myself and on my original UV-3R pressing the U/V toggles between UHF and VHF VFOs. HOLDING the U/V button for a while will switch to channel mode when I finally release the button. Holding it again will switch back to the VFO (and toggle) mode when I release it.

2956. Re: Firmware Changing Software?

Yahoo group: UV-3R (2011)
Date: 2011-11-02 04:19:51 UTC
From: David S
Topic: 2948 Message: 2956

maybe you should search the Wouxun group for the keyword unlock, in which case you would see that there is not only a lot of info on the topic, but even software in the files area that allows you to do these mods, this post in another newsgroup has more info on the topic:
http://www.worldwidedx.com/radio-radio-related-modifications/62063-wouxun-kg-uvd1p-software-mod.html

That said, no I have not heard of any such software for the UV-3R

--- In UV-3R@yahoogroups.com, "Steve" <k8sar@...> wrote:
>
> Thanks for the post however I doubt your Wouxun is actually functional through that range (although you may get the display to seem to indicate that). If you have indeed done what you claim then your welcome to share your application and insight to the 2000+ members of our Wouxun KG-UVD group at http://groups.yahoo.com/group/Wouxun_KG-UVD1/. None of them have made such a claim.

From: R O
Topic: 2957 Message: 2957

dear gents. I am now a proud owner of one of these radios. Mate bought one and when I go to load he file i get an eror message unable to read radio. Have tried to read from radio no good. Have tried different ports and another pc. What I am doing wrong. PC says com port 1 and I made sure com 1 was selected. other pc used com 5 selected that still no good. Device manager says all devices are working properly. Thanks

Richard

Hi Richard,
Did you push the connector deep enough in the porto ?
That solved my problem

2960. Re: Charging mod question

Yahoo group: UV-3R (2011)
Date: 2011-11-02 09:37:19 UTC
From: vimproved
Topic: 2954 Message: 2960

WTF are you on?

1. The schematic clearly shows there is a charge controller that takes care of the charging process.

2. Do not EVER put 5V across a 4.2V li-ion cell. It will explode and you will die. i.e. DO NOT ATTACH THE CHARGER DIRECTLY TO THE BATTERY. DO NOT USE THE CHARGING 'dock' THING.

--- In UV-3R@yahoogroups.com, "old_lew" <old_lew@...> wrote:
>

Is this flaming really called for, Vimproved? Old-Lew asked a quite reasonable question, and one that has not been queried on this forum before technically. The way you gave the response was unjustified.

2962. Re: UV3R range on PMR freqs

Yahoo group: UV-3R (2011)
Date: 2011-11-02 11:24:19 UTC
From: vimproved
Topic: 2950 Message: 2962

I shall answer in bullet points to get to the point.

1. PMR446 (EU license free band) operates on 16 channels from 446.00625MHz --> 446.19375MHz. The last 8 channels being reserved for 'digital' radios (there are no available digital radios...). Channels are spaced 12.5KHz, using narrow bandwidth and a bizzare offset of 6.25KHz.

2. To use the PMR446 the radio must:
-Not have a detachable antenna.
-Not exceed 0.5W.
-Must be CE approved for spurious emmissions.

3. PMR446 handsets ALWAYS claim wacky nonsense like over 900 channels (CTCSS & DCS) and 10KM range. This is mostly hyperbole and 'ideal conditions'.

4. Our FCC called OFCOM don't give a shit about what people do on the PMR446. As long as you are not taking the piss (400W, wideband, wiping out the whole band for example) no one else will notice or even care either. The only people who will bother you are uppity self appointed radio police hams, although thankfully they are mainly sticking to digital stuff on the VHF band these days.

So in conclusion, the UV-3R can be used as a high power PMR446 handset and is of reasonable enough quality that no one will ever notice you are using an illegal handset. The range depends entirely on the circumstances. Line off site in ideal circumstances I cannot see why you would not get over 30KM from them. The point is, with a tuned antenna and power cranked to the max you could be pumping out 9dB of power more than a legit PMR446 handset.

If you REALLY want to play nice, stick to channels 1 or 8. This is at the edge of the band and reduces the chances of splattering over on to the neighboring channels.

Personally, when on my motorcycle communicating with my wife I use digital channel 1. This ensures there will be no nobbers making animal noises over your transmissions. Also it minimises the impact I have on other PMR446 users.

You may also consider that there are other bands you could use...

1. SRD band, 433MHz. Shared with hams. Be EXTREMELY careful that you select a frequency that is not a repeater input or you WILL upset someone.

2. UK general VHF frequencies. Around 168-174MHz, DO YOUR RESEARCH FIRST!. Another group of frequencies OFCOM don't give a shit about. Provides a good opportunity to use VHF (better range at the cost of sound quality).

3. HAM VHF simplex channels. The Ham 'S' channels, around 144MHz. A bit more risky.

Obviously do your research first of all. You can get away with using most of the above bands if you are careful and make sure you are not stepping on someones toes. i.e. look up a scanner database to check the frequencies you intend to use are used for whom.

You can communicate perfectly well with legit PMR446 handsets, just be aware that there will come a point where the low power PMR handset will be able to hear you (cos you got the power yo) but you will not be able to hear him (due to lack of power).

Ya follow?

--- In UV-3R@yahoogroups.com, "Steve" <k8sar@...> wrote:
>
> Ignoring the legal and regulatory issues involved (although one can't really) you ask a question not really with a clear answer. For example, with my UV-3R I have made numerous contacts through orbiting satellites some 400-500 kms in orbit. My signal reached the satellites via "line of site" and rebroadcast them all through a satellite with a little 1/4 wave vertical antenna on it(I was using a handheld log periodic antenna)At the same time I have been operating in a car mobile to mobile through it's attached antenna and covered maybe 3 kms at best. It all depends.....buildings, line of site, hills etc. Sorry not much help.

2963. Re: Charging mod question

Yahoo group: UV-3R (2011)
Date: 2011-11-02 11:35:58 UTC
From: vimproved
Topic: 2954 Message: 2963

On the contrary, if I asked:

'A car uses internal combustion which is just exploding petrol in a chamber to create rotational movement. If I explode all my petrol at once will my car go faster? i.e. can I put a burning oily rag in my petrol tank to get total max bro style acceleration?'

The answer is:

'Holy sh*t, NO. If you do you will die.'

Similarly, only a complete twerp would connect a 5V charger directly to a Li-ion battery. If you cannot see why it is utterly critical he does not do this then fiddling with electronics is not for you. Further to this the schematics for the radio are widely available from the files section. In addition to this there have been several threads in which people have discussed the possibility of modifying the charging behavior by altering some internal components. So in short, if I go on a technical discussion group and say:

'I have not done any research what so ever despite the readily available documentation. Can I stuff a flaming oily rag in my gas tank to make my car go faster?'

I am going to get a blunt response.

It's called internal combustion because the fuel "combusts" or "burns", if it exploded it would be called internal detonation!
LOL
If you talked like that in the real world without a keyboard for protection you would find yourself in a whole world of pain...grow up!

Regards,
Jake

2968. Re: Firmware Changing Software?

Yahoo group: UV-3R (2011)
Date: 2011-11-02 13:23:26 UTC
From: vimproved
Topic: 2948 Message: 2968

If you look in the settings.ini file for the uv-3r you will see these lines:

[ModelInfo]

Freq0=[136-174/400-470]
data0=6013401700400047

Freq1=[144-146/430-440]
data1=4014601400430044

Freq2=[144-148/430-450]
data2=4014801400430045

The 'Freq' line is the label to be shown in the software.
The 'data' line is the binary coded decimal value to be sent to the radio. The data line is broken into 4 groups of 4 characters. i.e.

4014801400430045=4014 8014 0043 0045

The first 2 groups correspond to the VHF frequency limits, the second the UHF limits. You must revers the byte order to get the appropriate value.

4014 8014 = 1440 1480 = 144MHz->148MHz

As these are the raw values to be written to the radio I would assume you could change the value of 'data' to be whatever you want. FOr example I want to limit my radio to 430MHz->470MHz (there is sweet f-all below 430MHz in the UK) I would change 'data' to:

4014801400430047

This gives me 144->148MHz & 430->470MHz.

I have not actually tried this yet as I don't have a programming cable.

What would be totally awesome is if somone could get the dev board from the MCu manufacturer (around 50 euros) and dump the firmware. Then set the location the radio reads the frequency limits from as a pointer to the data in channels 95-99. We would then alter the freqs in these channels to define the bandwidths on the fly. That would make scanning a smaller bandwidth MUCH easier. It would be sooooooweeeeeeet!

(in fact if that was the case, I would find the 'scan' routine and change it to only scan in a 1-2MHz window only, now that would be badass.)

Attacking the semantics of an analogy...Well you sure showed me, I guess I will slither back under my bridge now.

He is right, I am a buffoon. By all means put a 5V, 1A supply across the terminals of your battery.

If you cannot see why it is utterly critical he does not do this then fiddling with electronics is not for you. Further to this the schematics for the radio are widely available from the files section. In addition to this there have been several threads in which people have discussed the possibility of modifying the charging behavior by altering

some internal components. So in short, if I go on a technical discussion group and say:

Subject: [UV-3R] Re: Charging mod question

WTF are you on?

1. The schematic clearly shows there is a charge controller that takes care of the charging process.

2. Do not EVER put 5V across a 4.2V li-ion cell. It will explode and you will die. i.e. DO NOT ATTACH THE CHARGER DIRECTLY TO THE BATTERY. DO NOT USE THE CHARGING 'dock' THING.

I wonder if I could connect the output from a NP-60 battery charger direct to the stand pins to charge the bat inside the HT? This way I can add a charging circuit to the base just by splicing a few wire and the cost is only 3 bucks.

Not semantics...just correcting the spread of misinformation.
Much as you profess to do, but without the vulgarities.
A respectful dialog will gain you more esteem. People tend not to give recognition to facts when being yelled at. Your point is correct but the message is lost in the delivery.

Regards,
Jake

For example, with my UV-3R I have made numerous contacts through orbiting satellites some 400-500 kms in orbit. My signal reached the satellites via "line of site" and rebroadcast them all through a satellite with a little 1/4 wave vertical antenna on it(I was using a handheld log periodic antenna)At the same time I have been operating in a car mobile to mobile through it's attached antenna and covered maybe 3 kms at best. It all depends......buildings, line of site, hills etc. Sorry not much help.

Act on what? If it is the coarse language, then you have my apologies. I will tone it down for the prudes.

If it is for the explanation of the frequencies then please consider:

1. The UV-3R has no certification and is therefore illegal to be used/owned by anyone who is not amongst one of the few elite hams that are allowed to run home-brew equipment.

2. I will wager >90% of the people in this group are not of said grade. Therefore they are breaking the law by even possessing this HT.

3. A person who has NO idea of any kind of band plan is more likely to be TX'ing in the wrong places (trunk channels, repeater inputs, emergency services, marine VHF, etc).

Thusly, if someone is committing crime (which the majority of the users of this group are just by possession) should we not do our best to minimise/mitigate the crime being committed?

Looks like a lossy dummy load to me. Consider the fact that
ANY antenna that is physically shorter than a 1/4 wave
length is a compromise, I would expect that antenna to be at
LEAST 6db worse than the antennas that come with the radio.

Also, it appears to be ridged as opposed to flexible and
would present (in my not-so-humble opinion) unacceptable
stress on the connector and radio body.

Something like that, with about two inches whip out the top would probably be half way decent for those that are near a repeater or close range ops. The one stubby I have, brand I can't remember, is fairly terrible.

I don't care for the language.

But the radio is legal to use in the UK.

Your spreading incorrect info about the legailty of curretn PMR446 operation (try looking up the latest OFCOM interface requirements!)
and you are condoning the pirating of the amateur bands of which
most of us on here have WOON the right to use legally, as well as
pirating UK General PMR freqs that companies like mine PAY to use.

So if you don't mind - naff off and stop spoiling our group.

Please backup your claims that it is illegal to own with links
to relevant regulations.

The various FCC amateur licensing grades do not appear to grant anything
more than increasing access to modes and bands.

This of course probably varies by country, if you are talking about outside
the US then you might be right.

>2 - if I use one uv3r (with 2w) and a normal PMR (0.5w), in the same hypothetical situation, what would happen? Would the uv3r send and receive properly at, say 6 or 8 kms, and listen clearly to the PMR while this one would not receive anything but noise?

I've recently made recently a test with a friend of mine, using the high power of my UV-3R and with a Taiwan Super RH-770 and we were able to make a very contact at about a distance of 32 km.
I was transmitting outside from my house balcony and my friend was on a hill, both living in the country.

And yes of course, in this confiugration, it's illegal and not reallly answer your question.

Thierry

2983. Re: UV3R range on PMR freqs - MODERATOR PLEASE

1. The UV-3R does not have CE type approval. While some may claim it does, the emissions on VHF would indicate otherwise. This would imply that NO ONE is allowed to use this HT unless they have a full (advanced) ham license that allows the use of home brew equipment. This is assuming you could pass of the UV-3R as home brew.

2. I have not Mis-represented the requirements of the PMR446 band. From ofcom:

"5. RADIO EQUIPMENT
PMR 446 radio equipment must be handportable, have an integral antenna, have a maximum ERP of 500 mW and be compliant with ETS 300 296.

PMR 446 radio equipment must use the above frequencies only. Radio equipment which can operate on any other frequency, including Short Range Business Radio (SRBR) equipment capable of using frequencies in the 461 MHz band, must not be used for the PMR 446 service."
--ofcom RA357

3. I am NOT advocating the illegal use of ham/UK general bands. The fact is this radio is illegal. Anyone can buy it and spam TX anywhere. It is far better people are informed as to where they can 'potentially' TX without causing disruption to emergency services ETC. Everything I have said WRT frequency usage ignores the legalities of using said frequencies. We are all adults here and thusly understand the consequences of breaking any given law we wish.

In fact I have gone above and beyond and said 'do your research, do not use repeater freqs etc'.

dear gents. I am now a proud owner of one of these radios. Mate bought one and when I go to load he file i get an eror message unable to read radio. Have tried to read from radio no good. Have tried different ports and another pc. What I am doing wrong. PC says com port 1 and I made sure com 1 was selected. other pc used com 5 selected that still no good. Device manager says all devices are working properly. Thanks

I bought a stubby from another Hong Kong emporium for £4 inc postage. I didn't expect much and wasn't disappointed, it was awful and not fit for purpose.
I checked it on an analyser and the VSWR on 70cms was about 1.5 to 1 but on 2 metres it was so high it was off the scale!
It wouldn't access a local 2 metre repeater some 2 miles away, which the stock aerial does with a good signal!
I complained and received a full refund and was told to bin the item as it wasn't worth sending it back.
I intend to to an autopsy on it at some point to see exactly what the problem is.
I'll stick with the two aerials that came with my Mk 1.

I also have this issue. I have the MarkII and got the latest software from our software section (1.09). Running the software gave the same device not found on port error. The only way i was able to get it to work was by turning off the radio while it was still plugged into the PC, then turning it back on, when you see the voltage information on the radio, click OK to Read or Write on the software and it should now detect the radio on the correct port. This is just a work around and not solution but if you just need to back up your data or upload new settings this will do the job.

I use 47 ohm resistors for my stubby antennas. Most of them are 1/2 watt and the radios have low power. This one would require a 2 watt resistor if you operate high power, which to me is contrary to why I would use a stubby antenna. I assume you would use a stubby antenna because you only wanted to talk a short distance. If your stubby is short enough your gain could be MINUS 20 DB or more negative.

Do not touch the 2 Watt resistor if you talk very long. It will be as hot as most incandescent night lights. FYI resistor dissipation is rated as the amount of heat it can dissipate in one cube foot of free air. - Jerry

Anybody out there use this antenna?

This antenna received good reviews in CQ magazine.

Quote: "I also found that the little UV-3R works great with a product I aquired at the Dayton Hamvention from my friends at Diamond Antennas, the SRFH-10 rubber anetnna for handheld radios. I tend to be skeptical about these short antennas, because I found out when I first tried one that they act more like dummy loads than antennas. The Diamond Antenna folks said this one was different, and I'm starting to believe that was correct. At less than three inches in length, this little dual-band antenna acts like it was made for the UV-3R, picking up all of the signals I've programmed into the radio from fire, police, and ohter public-service frequencies to many of the popular local ham repeaters. It works great and it looks great on top of the UV-3R."

Good point! Maybe someone should write up and post to files area a
bandplan for Canada and US, as well as UK , Europe, and Australia/NZ.

Volunteers? I'll do Canada if nobody else will, but I'm kinda busy
right now, it'll take a week or so.

Sent: Wednesday, November 2, 2011 9:04 AM
Subject: [UV-3R] Re: UV3R range on PMR freqs - MODERATOR PLEASE

1. The UV-3R has no certification and is therefore illegal to be used/owned by anyone who is not amongst one of the few elite hams that are allowed to run home-brew equipment. All Hams in the USA are allowed to run any equipment on their respective licensed bands as long as they are are observing proper technical operation. ALL HAMS are "ELITE" by your standards.

2. I will wager >90% of the people in this group are not of said grade. Therefore they are breaking the law by even possessing this HT.

Possession of this radio is not against the law in the US and most countries.

3. A person who has NO idea of any kind of band plan is more likely to be TX'ing in the wrong places (trunk channels, repeater inputs, emergency services, marine VHF, etc).Thusly, if someone is committing crime (which the majority of the users of this group are just by possession) should we not do our best to minimise/mitigate the crime being committed?
 see answer to #2 and there is no way to stop criminals from using any form of communication. under your description 2 tin cans and a piece of string would be illegal. FWIW a few years back the commercial companies decided to use an advertising campaign that claimed their radios were type accepted... Unfortunately newer hams took this as gospel.... the entire lines of radios pre this ad were not type accepted. and the dummies that believed this went out and bought new radios...DUH..
So my advice is research the thought before you commit it to the internet.
tnx

I agree...it has worked for me as well...the two PC I have used to back up the programmed channels and edit from both react to the the UV3R II and software differently, but bot have accepted it.

Subject: [UV-3R] Re: programming uv 3r

I also have this issue. I have the MarkII and got the latest software from our software section (1.09). Running the software gave the same device not found on port error. The only way i was able to get it to work was by turning off the radio while it was still plugged into the PC, then turning it back on, when you see the voltage information on the radio, click OK to Read or Write on the software and it should now detect the radio on the correct port. This is just a work around and not solution but if you just need to back up your data or upload new settings this will do the job.

I'm not entirely sure I support this stance.

I'd like to think that those opererators wishing to use such equipment
already come from a proficient background and looking to maximise the useability of their
purchase, and will probably be aware of any legal issues as well as being aware of the
spectrum they are using.

Often these are radio amateurs.

But just trying to assist John Doe's in a free for all, who are
just looking for a cheap way of circumnavigating traditional
entry into the world of radio useage is something I'm not
sure I like the idea of.

There are other groups that deal with this, usually associated
with hackers, pirate radio freebanders,scanners or CB ;-)

This group seems to have set a standard for excellent collaborative
technical investigation and exchanges relevant TO ALREADY COMPENTANT
RADIO PERSONNEL, and personally I'd like to see it continue in the
same way.

Whilst I have no desire to push my own agenda on anyone on here
and users are free to input what they wish, I do at least just wish
to make my views known ;-)

I wonder what others think ?

Remember, I'm just putting across a viewpoint.

Regards to all,

Andy

Hi Peter. Yes, it is actually preferable to use the latest software on the MkI as the earlier software has issues.....

On the contrary my good man. I cannot speak for the non UK (and probably EU) members of this group.

In the UK there are 3 levels of license holder. The first, 'foundation' can ONLY used approved HAM gear.

According to the terms of the amateur radio license ALL HAM radio equipment used in the UK MUST conform with IR2028:

"7(2) Where this Licence is a Foundation Licence, the Licensee shall only use commercially available Radio Equipment which satisfies IR 2028. Foundation Licence holders may also use Radio Equipment constructed using commercially available kits which satisfy IR 2028."

IR2028 specifies that:

"...in order to be installed or used in the UK, the equipment must meet the minimum requirements specified in this UK Interface Requirement for the stated equipment types and for the stated
frequency bands. Nothing in this UK Interface Requirement shall preclude equipment from being placed on the market in the UK that complies with the 'essential requirements' specified in Directive 1999/5/EC."

I will not quote 1999/5/EC here, however the relevant section is number 3. You can look it up at your leisure. It outlines how a piece of equipment must perform in order to be be CE type approved.

So at the end of the paper trail we can conclude that:

1. Unless you are a radio Ham with a full license, you CANNOT LEGALLY USE THIS RADIO IN THE UK/EU.

2. If you are licensed, you MUST modify it to fix the harmonic emissions.

3. I believe the FCC in the US more or less agree with the above except they have their own type approval to conform with.

"All Hams in the USA are allowed to run any equipment on their respective licensed bands as long as they are are observing proper technical operation. ALL HAMS are "ELITE" by your standards."

Lol wut? You need to go back and re-read the terms of your amateur radio license.

From: James Hall
Topic: 2950 Message: 3005

Despite the people going on and on about how the Wouxuns are part-90 certified and therefore legal to use, there is no certification for ham radio equipment in the USA. Ham radio is part-97. Part-90 covers commercial radios only. The conceit is that what's good for commercial radios must be good enough to be a ham radio. The lowest level license class can homebrew as long as they don't cause problems outside of the bands they're suppose to be in. I think there was even a line of Heathkits meant to be a first radio for a new ham with the old novice class license. That, or morse code was a lot more popular in the 60s/70s. :)

(part-95 covers the citizens band radios, including FRS/GMRS (our version of PMR, except in 462/467mhz) and MURS, if you were curious. None of these chinese radios are certified for that and the illegality is the same as using them on PMR over there.)

From: Remi Bilodeau
Topic: 2950 Message: 3006

Forget all about rule, regulation and illegal or not....

All hunter around me buy TON of this radio(and other) and use it anywhere... Nobody here can apply the rules anyway.

The only thing I can do is to give him some education about radio communication. I tell him to use only FRS frequency at 462/467Mhz and MURS at 151/154Mhz... Other "random" frequency can cause interference to police, emergency service, etc...

Radio is free to buy by anyone, so to protect public service and my ham band, the only thing I can do is to give him frequency cannot be harmful to anyone.

I don't see any other way to react about this...

Remi, VE2YAG

3007. Yet another n00B.....

Yahoo group: UV-3R (2011)
Date: 2011-11-03 12:54:20 UTC
From: WV6Z
Topic: 3007 Message: 3007

Just figured it was time to chime in and introduce myself as I have been lurking for a few days while I waited the arrival of my UV-3R MkII. Name here is Tom, I am an UK ex-pat and live in the upstate of South Carolina.

Well, it arrived in yesterday and after charging it up, the first place I used it was for the entire night shift at work and it performed flawlessly on 466.810 (our primary business band frequency where I work) for 8 hours + continuous monitoring with maybe a grand total of 1/2 hour's worth of transmitting. First amateur radio was on my commute home from work through town, using the local downtown repeater (N4AW our 146.970 machine). My signal and audio reports were very disappointing, to say the least..... and yes, I am keeping in mind the fact that I have read both here, as well as elsewhere, that the 2m band is NOT to optimum band for the 'new' dual band antenna. My disappointing reports, from two stations in round table discussion were pretty much as follows; "You're audio is crystal clear Tom, sounding great through the machine this morning" to "Barely a flutter or noise on your signal into the machine this morning Tom, the new rig is doing a fine job for you". Both stations recommended that I acquire one of those little mag mount dual band antennas with a SMA connector along with the car charger and that I should throw the old Icom IC28h and my equally pathetic Diamond antenna in the trash and just use the UV-3R MkII from now on..... even if I don't bother to opt for the external antenna and the means to power the rig should my battery get low after a busy night at work (11:00pm battery level reading 4.1v / 7:40am voltage reading was 3.8v)

Now to many, this may be just amusing, but I didn't..... my only question is why the heck did Baofeng wait so long to enter the market globally for goodness sake! The price of my Diamond antenna and mount alone could have netted me four UV-3R MkII HTs! Disappointing signal reports? Yeah, you betchya! Pretty sad to have a 2w HT that costs less than $50US out perform a mobile station that I could sell still to this day for pocket money to buy three more of these little boxes of miracles.

So yeah, that is my 17 hours or less of use with the new rig. Even if it croaks within the next five minutes, it will have served it's purpose..... and that is to give me a hint it's time to retire the present mobile station.

Now, to program some memory 'channels' before I head off to get my beauty sleep. All I need to remember now is how the heck to recall the memory channels after I have stored them. Plenty of info that is clear enough to understand and tolerate with regard to storing them on page 29 of the manual, no hint as to how to recall them. No worries though, no doubt I will stumble across how to do it again, or, I am sure I will find the answers here.

Oh and by the way, it was nice to not have that damned VX-361 Yaesu (Standard / Vertex) 'P.O.S.' weighing down my belt and pulling my damned trousers down all night too. The UV-3R fit comfortably in my pocket and left me thinking that maybe I don't need to buy a pair of suspenders after all.

Welcome Tom
Search the web (or this forum) for uv3r cheat sheet, you'll find How to save and to call memorized channels

Indeed. Makes you wonder how long it will take them to enter the HF market. I'll bet the big three are watching this closely. Can you imagine a FT5000 clone for $1,00 instead of $5,000?

When used with a 2m or 2m/70cmantenna, the 2nd harmonic radiation is nil.
I was not able to detect it with my spectrum analyzer. An antenna resonant
at 2m and the 3rd harmonic at 70cm will present a high impedance at the 2nd
harmonic. So you don't have to fix the LPF if you use it only with the
supplied antenna.

Yes I do too. Also, looking forward to the forthcoming 2m/70cms 60/40w mobile rig, the VR6600, due out early next year. It'll be interesting to see what price point this will be at, as basically it's a UV-3R with a larger PA on, and a different case of course (the only real difference is it has 512 memories and a wireclone function). It can be seen here:

http://www.vgc.hk/Dual-Band-Mobile-Radio-VR-6600.htm#

I looked at the link. I see NO DTMF mic. As a mobile I would like the DTMF tones available for IRLP and Echolink access.

I hope they do come up with some HF equipment ASAP. Right now I don't have HF gear and/or enough money.

Indeed. Makes you wonder how long it will take them to enter the HF market. I'll bet the big three are watching this closely. Can you imagine a FT5000 clone for $1,00 instead of $5,000?

It wasn't bought from 409Shop Bob, just off eBay.

>
> Well, it arrived in yesterday and after charging it up, the first place I used it was for the entire night shift at work and it performed flawlessly on 466.810 (our primary business band frequency where I work) for 8 hours + continuous monitoring with maybe a grand total of 1/2 hour's worth of transmitting. First amateur radio was on my commute home from work through town, using the local downtown repeater (N4AW our 146.970 machine). My signal and audio reports were very disappointing, to say the least..... and yes, I am keeping in mind the fact that I have read both here, as well as elsewhere, that the 2m band is NOT to optimum band for the 'new' dual band antenna. My disappointing reports, from two stations in round table discussion were pretty much as follows; "You're audio is crystal clear Tom, sounding great through the machine this morning" to "Barely a flutter or noise on your signal into the machine this morning Tom, the new rig is doing a fine job for you". Both stations recommended that I acquire one of those little mag mount dual band antennas with a SMA connector along with the car charger and that I should throw the old Icom IC28h and my equally pathetic Diamond antenna in the trash and just use the UV-3R MkII from now on..... even if I don't bother to opt for the external antenna and the means to power the rig should my battery get low after a busy night at work (11:00pm battery level reading 4.1v / 7:40am voltage reading was 3.8v)
>
> Now to many, this may be just amusing, but I didn't..... my only question is why the heck did Baofeng wait so long to enter the market globally for goodness sake! The price of my Diamond antenna and mount alone could have netted me four UV-3R MkII HTs! Disappointing signal reports? Yeah, you betchya! Pretty sad to have a 2w HT that costs less than $50US out perform a mobile station that I could sell still to this day for pocket money to buy three more of these little boxes of miracles.
>
> So yeah, that is my 17 hours or less of use with the new rig. Even if it croaks within the next five minutes, it will have served it's purpose..... and that is to give me a hint it's time to retire the present mobile station.
>
> Now, to program some memory 'channels' before I head off to get my beauty sleep. All I need to remember now is how the heck to recall the memory channels after I have stored them. Plenty of info that is clear enough to understand and tolerate with regard to storing them on page 29 of the manual, no hint as to how to recall them. No worries though, no doubt I will stumble across how to do it again, or, I am sure I will find the answers here.

From: markwhitis
Topic: 2901 Message: 3024

> A Review of the Handheld VHF/UHF Transceiver
> The amateur radio rig UV-3R is manufactured in China. Its heart is the one-chip transceiver RDA1846 from RDA Microelectronics in Shanghai which is a software-defined radio (SDR) for 136-174 MHz (VHF) and 400-470 MHz (UHF). Two PAs, one for VHF and one for UHF, produce a transmit power of 2 W. A 1-chip FM radio for 87.5-108 MHz is also built into the rig.
>
> The receiver does not use any ceramic or crystal filter. It is an IQ direct-conversion receiver where a DSP (digital signal processor) is responsible for selectivity. Problems of the first generation, like transmission of harmonic signals, have been solved (as of September 2011).
>

It is misleading to use the terms Software Defined Radio (SDR) or Digital Signal Processor (DSP) in connection with this primitive FM radio. There is no software in the signal path which can be defined by the user or even an MCU firmware update. At best, you have a DSP which is mask ROM programmed when the chip is made. No RAM or flash which can be updated. It is quite possible that the "DSP" isn't even a DSP in the traditional sense of a stored program microprocessor optimized for processing of digital signals. Rather it may be hard wired logic which combines adders. multipliers, and sin/cos lookup tables into a fixed circuit. No FPGA, either. You can't change the algorithm, only the parameters to the algorithm.

You can't change the code to implement CW, SSB, AM, PSK, digital audio, weather fax, slow scan tv, packet radio, APRS, QAM, 8VSB, ATSC, scrambled or encrypted audio, HF FAX, ATV, SSTV, GSM, multipath cancelation, noise filtering, spectrum analyzer, etc.

At some point in the development of the RDA chip,they might have used a real SDR with a DSP and FPGA to debug and test the algorithms. Once that was accomplished, however, they were reduced to a hard coded implementation. All you have left is some virtual knobs and switches. Ten steps forward, nine steps back.

3025. Re: UV3R range on PMR freqs

Yahoo group: UV-3R (2011)

Topic: 2950 Message: 3025

> So in conclusion, the UV-3R can be used as a high power PMR446 handset and is of reasonable enough quality that no one will ever notice you are using an illegal handset. The range depends entirely on the circumstances. Line off site in ideal circumstances I cannot see why you would not get over 30KM from them. The point is, with a tuned antenna and power cranked to the max you could be pumping out 9dB of power more than a legit PMR446 handset.

This (30km) is precisely one of the reasons restrictions on power and antenna are there. If you get 30km range (non-directional) on a band where you are supposed to get 3km range, then you are using up that channel over 100 times the geographical area. If everybody does this, then the band can support 100 times fewer users.

Further, unlike a high-gain antenna, increased transmitter power (in excess of that available legally to other users of the band) means that you can be heard (and trample other users) without being able to hear them. You cannot tell that you are interfering with other user's communications and you cannot hear emergency distress calls, "beak break break", or instructions to cease and desist transmissions that interfere with distress related communications. While such disparities are inevitable on ham bands, they may not be tolerated on others. Of course CTCSS interferes with hearing other users on the band as well; hence the requirement to un-mute squelch before transmitting.

>
> If you REALLY want to play nice, stick to channels 1 or 8. This is at the edge of the band and reduces the chances of splattering over on to the neighboring channels.

You have this backwards. You reduce the chances of splattering the less important unlicensed channels at the cost of increasing the interference to adjacent services which may be more tightly regulated and more critical.

This also ignores the issue of spurious emissions on harmonics. Most of the ham bands are allocated such that the harmonics of one ham band fall inside another ham band. Thus harmonic interference generated by hams tends to affect other hams, not non-recreational users. And ham's police our own bands so that they do not become unusable.

Another post asserted that mere possession of these radios is not illegal in the US. In half a dozen US states, operation (receive) and in some cases mere possession of a scanner or similar device which can receive police dispatch frequencies in a vehicle and/or hand portable is illegal; there is an overriding federal exemption for hams (with transceivers, not scanners). In a dozen other states, it is illegal to have a scanner only if you are committing a crime (or in some cases have a past felony conviction).

Personally, I think the regulations are overbearing when they prevent operation of equipment that complies with the power, bandwidth, modulation, antenna/ERP, and spurious emissions requirements of specific sub-bands by those who would otherwise be legally allowed to use them when such equipment is operated by licensed radio operators and/or has safeguards built in to the user interface to deter inadvertent non-emergency operation on unauthorized frequencies (i.e. it has configurable limits and warnings).

Some folks on this list need to learn to trim included text.

Having been with this group almost from the start and having owned a UV3-R for the better part of a year now, I am increasingly amazed by the moans and whines about the set's shortcomings.

This is hardly a top end of the range piece of kit after all.

I paid less for mine with 2 batteries than the cost of two thirds of my average weekly petrol (gasoline) bill here in the UK and for those in the States who are unaware of our fuel costs, you are all living in fuel price heaven compared to the UK.

So many armchair experts surface to say what rubbish the UV3-R is, what it should have had, how it should perform and what Baofeng should do to improve it, seemingly forgetting just how damned cheap and cheerful the thing is.

I suspect that 99.9% of purchasers brought it purely because it was that cheap rather than pay through the nose for a Trio/Yaesu/Alinco/etc.

Surely no one buys a dual band rig for around $55 (£40) and expects that it's going to have 100% earth shattering performance? If they do then I am interested what colour the clouds must be in cuckoo land.

Yes it's cheap and (sort of) nasty - you pays your money and you, to my mind, still get a damn sight more than you could normally expect to.

I wonder how many people who complain about the UV3-R would also buy a cheap car and then whine that it doesn't have the acceleration of a Pagani Zonda, the comfort of a Rolls Royce and the economy of a Prius?

Oh - and when are people going to start reading the hand book or browsing the group archives before asking the same tired old questions time and time again?

Pi**ed off? Yes I guess I am which is why I am now setting my options to read the site on the web and stop getting repetitive group posts.

Have fun.

Slim

3028. Re: [UV-3R] amateur bands only

Topic: 2927 Message: 3028

On Mon, Oct 31, 2011 at 8:44 AM, <cartronics@> wrote:

> I was just reading the FAQ and it mentions frequency span may be illegal in your country,this can be changed,
> I noticed on my uv-3r software there are two boxes one that enables the amateur bands only to be set.

I wrote that. I do not own the programming cable, so I cannot test
what happens if I try that setting on the software. So, does that
software setting ACTUALLY restrict the UV-3R range?

As the radio comes fully open from factory some Countries' Customs
authorities might not let it through just because of that.

BTW, thank you for reading through the FAQ!

I have to agree with the comments that one needs to temper one's expectations of the radio in light of the price. There are, of course, things like the volume level problem that would seem easily solved in the next production run at little or minimal cost by using a different value resistor. It is not clear why this hasn't been done already.

As long as one recognizes the limitations of the radio, it is a great value. The fact that it is Part 90 accepted makes it useful for those of us who are appropriately licensed there. For example, if I were supplying radios to a community event that needed short-range coverage for part of a day, I would seriously consider using the UV-3R due to the low price, especially if I was concerned that some of the radios might walk away. Next up on the scale would be Wouxun, followed by ICOM (etc.) and then Motorola's higher end products.

While it is legitimate to criticize the radio in the hopes that seemingly simple improvements will be made in the future, the reality is that it is remarkable for the price. It is certainly more radio for the money than the bubble-packed FRS units. (Note: I am not advocating using the UV-3R on FRS.)

Topic: 3027 Message: 3031

I like my UV-3R's just fine for what I paid for them. However, my primary repeater that has all my friends talking on it has an issue with either a dirty signal or over-modulation or something that overloads my UV-3R receiver such that the receiver cuts out, bad enough so that I cannot copy the talker. So, I am NOT using it very much except for simplex operation. This is a big bummer for me, because I really like the radio.

The interesting thing is that it works fine on other repeaters, but I also notice the problem on simplex if the transmitter is too close. The receiver is apparently getting overloaded and, perhaps, it's dropping the signal to protect itself (?).

Anyway, it's a nice little radio, with a hot receiver and nice transmitted audio, but this "minor" problem is biting me hard. As such, I cannot recommend this radio to my friends--especially to users of the same repeater than I'm using. Yes, I believe the problem is with the repeater and not the UV-3R, but that doesn't help me much when using the UV-3R on this repeater. Others aren't complaining of the problem with their radios, although I COULD bring up the issue with the club that owns it and see if they could fix it.

Interesting situation, to be sure.

From: DavidN
Topic: 3027 Message: 3032

Hi Darvel. Yes, as you say the problem is with overdeviation of the transmission by the repeater. It may be that the filters in the repeater are too wide and letting through overdeviation by amateurs with their rigs. The repeater keeper could solve this by turning the output deviation down, but this would then make users with correct deviation sound a little quiet. However, this could be picked up by the receiving rig by turning up the volume slightly of course.

Or, it may be that users are using normal deviation but the repeater's output deviation is too high. Again speaking with the repeater keeper and requesting as an experiment for the deviation to be turned down a little could solve it - a five second job.

However, to get good limiting with the FM system the receiver deliberately overloads (clips) the incoming signal, whether strong or weak, and as others AREN'T complaining of this cutting out problem, and as you're having problems with a strong signal too, it could be that component tolerances in your rig are just enough out for there to be a problem with your particular unit.

I must say I've never had this problem. There are about eight repeaters I pick up in this area of North-West England, including the local one which is very strong (GB3OA). I'm a good friend of the repeater keeper and we have stood within 10ft of the antennas and had no problem :) (obviously you don't want to get too close or you'll fry the front end :( ).

Hope this helps and wish you well as I can understand that it's irritating that you can't join in the net with the UV-3R.

Regards, David G4TUP.

You may have tried or thought of this but what if you attenuated your receive by using a stubby antenna...something like that...wide vs narrow...maybe? You are right though the receive on the UV-R3 is really good! I have Two of The UV-R3 II and fine them to be an amazing bang for the buck! A low risk potable option when it just isn't work having a more expensive radio with you...a decent first HT option for new Tech License Ham...The only option I had was an old massive HT with really bad battery life or an Radio Shack HTX202, so opted for a more expensive mobile instead....and even now the mobiles are coming out of China....looking forward to seeing what they can do with a dual bander under $200 and if that drives down the big three prices a bit all the better...
John - KE4HGR

Subject: Re: [UV-3R] What do people want for their money?

I like my UV-3R's just fine for what I paid for them. However, my primary repeater that has all my friends talking on it has an issue with either a dirty signal or over-modulation or something that overloads my UV-3R receiver such that the receiver cuts out, bad enough so that I cannot copy the talker. So, I am NOT using it very much except for simplex operation. This is a big bummer for me, because I really like the radio.
The interesting thing is that it works fine on other repeaters, but I also notice the problem on simplex if the transmitter is too close. The receiver is apparently getting overloaded and, perhaps, it's dropping the signal to protect itself (?).
Anyway, it's a nice little radio, with a hot receiver and nice transmitted audio, but this "minor"
problem is biting me hard. As such, I cannot recommend this radio to my friends--especially to users of the same repeater than I'm using. Yes, I believe the problem is with the repeater and not the UV-3R, but that doesn't help me much when using the UV-3R on this repeater. Others aren't complaining of the problem with their radios, although I COULD bring up the issue with the club that owns it and see if they could fix it.
Interesting situation, to be sure.

Subject: [UV-3R] What do people want for their money?

Having been with this group almost from the start and having owned a UV3-R for the better part of a year now, I am increasingly amazed by the moans and whines about the set's shortcomings.

This is hardly a top end of the range piece of kit after all.

I paid less for mine with 2 batteries than the cost of two thirds of my average weekly petrol (gasoline) bill here in the UK and for those in the States who are unaware of our

fuel costs, you are all living in fuel price heaven compared to the UK.

So many armchair experts surface to say what rubbish the UV3-R is, what it should have had, how it should perform and what Baofeng should do to improve it, seemingly forgetting just how damned cheap and cheerful the thing is.

I suspect that 99.9% of purchasers brought it purely because it was that cheap rather than pay through the nose for a Trio/Yaesu/Alinco/etc.

Surely no one buys a dual band rig for around $55 (£40) and expects that it's going to have 100% earth shattering performance? If they do then I am interested what colour the clouds must be in cuckoo land.

Yes it's cheap and (sort of) nasty - you pays your money and you, to my mind, still get a damn sight more than you could normally expect to.

I wonder how many people who complain about the UV3-R would also buy a cheap car and then whine that it doesn't have the acceleration of a Pagani Zonda, the comfort of a Rolls Royce and the economy of a Prius?

Oh - and when are people going to start reading the hand book or browsing the group archives before asking the same tired old questions time and time again?

Pi**ed off? Yes I guess I am which is why I am now setting my options to read the site on the web and stop getting repetitive group posts.

Have fun.

>Regards, David G4TUP.

You make some good suggestions, David, thanks. I will try them. And, btw, I am observing this problem with TWO UV-3R's and one UV-3R Mark II. Identical issues with all 3. In fact, I can put them all side-by-side and the green LED goes out and the receive signal drops AT THE SAME TIME on all three of them in sync.

Adjusting the narrow/wide option and other options has not fixed the problem. I DO believe the problem is with the repeater, not the Baofengs, but I can't directly change the repeater, only what radios I use to access the repeater. I also know I'm not the only one in this email group that is experiencing this problem.

From: john zenick <johnzenick@...>

You may have tried or thought of this but what if you attenuated your receive by using a stubby antenna...something like that...wide vs narrow...maybe? John - KE4HGR

That's an interesting idea, John. Drop the gain to reduce the overload. I will have to try that. Changing the wide/narrow option didn't help.

Both my son and my wife don't get on the radio much, so the UV-3R's have been given to them. They haven't been on the repeater much and generally only use their radios in simplex mode.

Thanks for the comments, guys.

In the meantime, I have "spent my money" on a "better" radio so I don't see this problem--a Yaesu VX-8GR, which I don't love, but it's nice enough to keep around for use on the "offending" repeater (it also has it's strange irregularities, too, even for more money).

What your story would tell me as an administrator of a repeater is
that it's time to check our modulation! Possibly bandwidth as well.
I'd think they'd be inclined to react on the user feedback on their
next trip up there - probably soon, if it's anywhere the snow flies!

Yes, only the top freq. can be programmed and switched between VFO and Memory Mode.

The bottom freq. is strictly VFO mode.

From what I understand on the UV-3R Mk I and Mk II the name function is not operational on the radios. So no matter what you put in the name column, the radio will only show freq.

I had this problem initially. The squelch would intermittently drop out,
even on weak signals. I had the rcvr wide/narrow set to narrow - after all,
it is NBFM. Setting it to wide fixed it for me.

Hi Paolo,

I have just tried the amateur bands only in the software
it appears to do just that, in the latest software
you can set it to:

136-174/400-470
144-146/430-440
144-148/430-450

And the FAQ is worth reading (I think everyone would benefit from doing so.

All the best.....Peter GW4ZUA

I have the same problem with a local repeater as well. In this case, the repeater asserts a PL tone on both input and output. It turns out that the UV-3R doesn't decode PL robustly. Turning the PL decode off solved that problem.

Now, inexpensive as the UV-3R is, I find it below my personal threshold for minimum usability as a general purpose radio. The PL issue above is a problem. I also find that the front-end is pretty easy to saturate.

Having said this, however, I do find the UV-3R to be damn good as a wireless mic for my remote base.

Hi,
Looking at the schematic..... looks like the RX frontend (RX RF preamp) for either band is not AGC controlled. Frontend overload and image problems will start to happen when close to a really strong transmitted signal. Overload of the frontend most likely will cause all kinds of weird reception problems.

If you can key the repeater up on low power then you may be close enough to experience problems. If you can key it up without an antenna mounted then you are way to close.

Another thing to look at is if the receiver is set to narrow T/RX which can cause clipping and may trigger squelch to cut out the audio. Also, if the receiver is slightly off frequency (5K) then the same thing may happen.

Back on topic... these are great radios for the money and I have recommended them to everyone that wants to get on the air cheep or needs a very simple backup radio that has some limitations.

What do I expect for the money.... way less than I got. The UV-3R has raised the standard for what the low end of the ham market can expect.

One known "feature" of these radios is that if you are tuned to an out of band frequency when you power the radio down, it assumes memory has been corrupted and resets memory to factory defaults. Tuning to a valid frequency before powering down prevents this (until you screw up).

The bandpass filters could also limit operation outside the intended range even if you get the firmware to cooperate.

In a message dated 06/11/2011:

Looking at the schematic..... looks like the RX frontend (RX RF preamp)
for either band is not AGC controlled. Frontend overload and image problems
will start to happen when close to a really strong transmitted signal.
Overload of the frontend most likely will cause all kinds of weird reception
problems.

Hi John,

Worked for a number of years maintaining commercial LMR FM radios and have
yet to find one that uses AGC on the RX. AGC could cause problems with
the IF limiting action which adds to the value of FM being able to disregard
impulsive noise, one of the key points of the system. When I have modified
AM LMR radios in the past to FM for ham radio, the use the use of AGC on
the original AM IF can sometimes make things difficult to get the best out of
the system.

To date the only radios seen that give any reply to overloading from high
level signal are some of the Icom ham radios that reduce the front end gain
by about -10dB when the squelch control is turned up to a higher level
above the normal threshold.

It used to be the case that FM radios covered just the ham bands and some
had reasonable front end filtering as most of the LMR radio do. However,
with the demand by the ham users to cover from DC to light this becomes
almost impossible and overloading can occur with most modern ham radios in
locations where there are high level signals. I find severe difficulties in
using ham radios near comms sites where an LMR radio would be relatively
unaffected.

The UV-3R series for what is costs is extremely good value for money and
in general works quite well. The power output at 2W gives a reasonable
battery life and as a bonus the replacement batteries are extremely cheap. Tried
pricing a replacement battery for my Icom IC-E91 dual band D-Star radio
and for the quoted price could buy in HK two UV-3R complete with
batteries/accessories or one from a dealer here in the UK with sales tax included in
the price.

It may be that the Chinese manufacturers of the UV-3R will eventually
resolve some of the niggles that raise complaints from some users in this group,
but would not hold your breath! Doubt if ham radio users are more than a
very tiny percent of the user worldwide for the radio and they could not
care less or are even aware of any problems.

Regards,
Bob, G3VVT

Also, to turn off the Alert siren, press the PTT then press the red L/R button on the side. That turns off the alarm but turns on the LED flashlight. Press L/R to turn off the LED flashlight.

The manual says to turn off the Alarm you need to just press PTT, but that does not work on my Mk II.

Maybe add this to the FAQ document.

I told a guy at work about the UV-3R's as well. He's not licensed yet, but is planning to do so soon. He got his UV-3R last week, in anticipation of passing the test. (Yeah, he's only planning to listen until then.)

Anyway, this guy was showing off his new radio to a co-worker, who is also interested in HAM radio, but isn't licensed either, but uses a Yaesu VX-1R to listen. The guy with the new UV-3R triggered the panic alarm while showing off the radio and he didn't know how to turn it off. Hehe, pretty funny.

I turned on the panic alarm myself, but at least I was home and could figure out how to shut if off in private! LOL.

I don't think the alert gets transmitted over the radio. It only comes through the radios speaker, I hope.

If it does get transmitted, the local repeater users must be wondering what was going on when I was testing!

The solution is in the FAQ. See either Files section or the copy here:
<http://www.scribd.com/doc/69567232/Baofeng-UV-3R-FAQ-v-2011-10-12>

Paolo

3071. From the FAQ, tuning outside the allowed range, clarification needed.

Yahoo group: UV-3R (2011)
Date: 2011-11-08 15:02:07 UTC
From: Paolo Cravero
Topic: 3071 Message: 3071

Gents,
I am checking the latest FAQ updates before releasing a new PDF consolidated version and I cannot understand how this can be done.

One Q&A says:

My UV-3R just completely reset itself. Why?
If the frequency on the display was outside the normal range, e.g. 133MHz, when the UV-3R was turned off, it will completely reset itself to the factory default when you turn it on.

Heinrich DB9PU explains:
The firmware checks the active frequency during the shutdown procedure and, if the frequency is outside the firmware range of allowed frequencies, an internal failure of the microprocessor is assumed and a hardware reset will be made.

To avoid this:
1. before switching off choose a channel with a frequency in the range 136 to 174 or 400 to 470MHz
2. switch off.
<end of FAQ paste>

Can someone please explain me how to tune the UV-3R outside the allowed frequency range? I cannot get my MkI to tune outside the allowed range with the radio keypad. I assume the software also does not allow to program memory channels that lie outside the frequency ranges. I even tried to tune 136 MHz and set a negative split: it doesn't let me transmit.

So, how is that possible?

I like to freaked when I first turned mine on! The only reason I can think of for it, though, is as a "call" signal to other stations. On one of the "civilian" freqs of course - such as with tones set up for send and receive, on the PRS frequencies. Other than that, what? A distress signal for ma'mselle when being accosted in a parking lot? The audio isn't loud enough to discourage footpads, I don't think. It would be embarassing to use it inadvertenly on a ham repeater - but I'm sure it will/has happen(ed)!
ps

>On mine, PTT shuts off the on transmitted alarm, the orange button
>(L/R) shuts off the local alarm and turns on the LED light.

What? There are TWO alarms? What, please, are the ways to turn on the local alarm, and what for the transmitted? (I DO have the light figured out!)
tnx,
ps ve7ekf

3076. UV-3R repeater system

Yahoo group: UV-3R (2011)

Neat. I've thought about this before, congrats on doing it. I bet someone could make a 2m/440 crossband repeater for a balloon experiment sometime. In on 2m, out on 440 or visa versa. Could do that without the duplexer and with very minimal interfacing. Hope to read more on your project when you act on your notes to self there. :)

Subject: [UV-3R] Baofeng Spare Parts

While browsing the 409Shop site this morning I noticed that they now stock a full range of spares for the Baofeng radios.
I know some here have asked for some of these consumables in the past.
Good to see they are now available.
Link below:

http://www.409shop.com/409shop_shopcat.php?&usercat=1693&parentid=1693

Not quite a full range, although surprising to see that you can buy a replacement metal chassis and pcb. No cases listed, yet they must be available as Ed has them?

Hey, cool. So those $80 Chinese direct import duplexers I see floating around EBay really does work.

What are you using as a repeater controller? Or are you just directly wiring squelch opening on the receive side to the PTT on the transmit?

Robert

Have another look Bill.
http://www.409shop.com/409shop_product.php?id=106490

I also find it somewhat ironic that the UV-3R MKII dual display replacement LCD is almost half the price of the older single frequency display.
Oh well at least some rubber items and display covers are there to be replaced when they start to show their age.

From: dkocivar
Topic: 3082 Message: 3082

My radio {UV-3R] has channels 1-99 and I have not seen any info regarding the so called "emergency channel" .
Does it actually exist ? If so, how do you program it or get to it ?
I am programming my radio manually, as I have not been able to get the computer to connect with the rig.............I think it's a com port problem which I haven't been able to figure out yet.

Anyone with info ??

Not sure, but I think the emergency channel is one you (optionally) set
when programming the radio via software.
Check out the FAQ or the files section for cable connection troubleshooting.

From: fourzan
Topic: 3088 Message: 3088

I am a teacher and during afterschool hours I am teaching a ham class to high school students. The school administration and I would like to give out UV-3R radios to our students upon obtaining their technician license.

Is there a place, store, etc., in the USA that sells the UV-3R? It is the only way we can pay for them, if they are bought inside the USA. I live inTexas and purchase orders in our school districts are only accepted if they come from within an established business inside the country.

Thank you

Richard

Can you substantiate this with some evidence? I would certainly appreciate knowing if this is so.
As Jack mentioned, I too can certainly entertain a more viable method of making money than tooling up for manufacturing a counterfeit radio at this price point.

Not that I have an interest of any sort with the 409Shop, but having personally handled 9 Baofeng UV-3R HTs from various sources, I can honestly say that I can't tell of any difference.
Every one that I have handled has been both physically and functionally a virtual clone of the other.

Regards,

Jake

3098. programming uv3r with Chirp software & DAT files

Yahoo group: UV-3R (2011)
Date: 2011-11-09 19:23:11 UTC
From: Nuno Xavier
Topic: 3098 Message: 3098

Hi all
Anybody has good tips on combining DAT files?
Namely, I'd like to join two DAT files (adding the already programmed frequencies -aprox. 40- with a filtered list of national repeaters) but this is impossible (?) on Baofeng software.

On the other hand, CHIRP allows editing a csv file on MSExcel, but I'm afraid later I can't put it back in the Baofeng.

Any tips?
If not, can anyone show me directions to the best use of Chirp software and uv3r?

Thank you
Nuno

3099. USB programming cable problems solved.

Yahoo group: UV-3R (2011)

From: pa3bya@amsat.org
Topic: 3099 Message: 3099

The prolific USB programming cable gives lots of problems.
The latest driver from prolific does not work with this cable.
You have to use a weird old driver used for GPS equipment in the past (PL2303_Prolific_GPS_AllInOne_1013.exe).
It does not work with Mac OS X, don't know about Linux.
For the BF-U3 It does not work with the 1013 driver it only works with Windows XP, not with Windows 7.

for this reason I replaced the interface with a SparkFun FTDI Breakout board (http://www.sparkfun.com/products/9716).
This one works like a charm.
I can use it to program my BF-U3 from a mac, using chirp.
Furthermore I also can program my BF-U3 using Windows 7.

I removed the cable from the prolific board and soldered it to pin headers which fit in the header connecter of the SparkFun board. For what its worth: black to ground, green to tx, red to rx.

kindly,
Gerrit.

I own a UV-3R, a couple of Wouxuns and other radios. I have the same problem with the UV-3R. The tone decode on this radio is not robust. Just turn it off. If you get too many false squelch opens (because you're relying solely on carrier squelch now) give up and use another radio.

I have two Mk2's coming. Is there a revision number printed on the board that I can reference to be sure I'm modding an older board? If they did indeed correct the spurious emissions, what would happen when I put the cap in?
Hugs,
Della

Gents,
The photo "POS Charger" posted here:

http://groups.yahoo.com/group/UV-3R/photos/album/1077191282/pic/256886702/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc

shows the the so-called charger has no internal circuitry.
As I understand it, the cheapos depend upon the internals of the battery to keep it from exploding when excess current is applied.
Lew has a valid question.
I'd like to know the answer myself.

Now, everybody go to your rooms until somebody comes out with an answer.

Hugs,
Della

Mike,

You have an iPad - it has a speaker. You could make sound files of the tone sequences (incl ABCD) that you need from this web page:
http://dialabc.com/sound/generate/
Save files on your iPad, play when needed (place speaker next to UV-3R mic). It usually makes a difference what "press rate" you establish, not just the volume. Sometimes too long get miss-interpreted as "two touches same digit", and too short is ignored as static. Varies by how each receiver is set up. This web app lets you match the needs of the repeater.

Casio in the late '80s made a small calculator that had phone-address files and would play the phone number out a rear speaker. It was super for keying in long-distance credit cards and phone numbers over rotary devices. Like an old dial-up modem, one could insert pauses. Sadly, no longer made.

You could lug this around http://www.foxelectronics.net/TS-202.html and make ad-hoc timed-tone bursts.

Here's an excellent description (for those who think DTMF is just "dial tones")
http://www.genave.com/dtmf.htm

They make/sell ICs that do the work. You'd need a keypad, speaker, and powersupply to make your own.

As of this writing, there's a lineman's DTMF on eBay for $15. The coupler is called a "720 Interface" and in total is about the size of a handset. But it will do the job, I know from personal experience.

I wish that Casio were still around.

Hugs,
Della

Lee,

Yes, for me your reply helps me get to an answer for the original question.

I first saw the photo for MAX1911, and then saw the POS photo. Huh, I've got $2 USB AA chargers that came with charging circuits. It's a terrible place to save money at the expense of the consumer.

Although new to this radio, I did know the intent is to charge the battery outside the radio case, which is why I opted for two extra batteries per radio. One xmitting, one in the batter's circle, one on deck "warming up". But I kinda expected a controlled charger, not a 5vt until the batteries cut out wonder. Silly me.

Anyway, I'm thinking that the only way the battery *in* the case can get charged *through* the protective charging circuit is to use the radio's jack for a power cord.

But I think Lew has a workable idea about an inexpensive way to use the outside charger (I've edited his words to that effect):

> I wonder if I could connect the output from a NP-60 battery charger direct to the UV-3R's charger pins to charge an external battery with a regulated and controlled current? This way I can add a decent charging circuit to the supplied charger just by splicing a few wires, and the cost is only 3 bucks.<

I think he's hit on a way to inxpensively mate the form of the UV-3R charger to the *regulated* output of a decent charger. But he'll have to settle for not "dropping in" the entire radio.

Thanks Lee for helping me to work through this. Feel free to have as much ice cream that you can find in the 'fridge.

Hugs,
Della

SHARP EL-6250 LCD DTMF

There's one for sale on eBay. Very much like what I used to have. It only costs the price of three UV-3Rs and change. Plus shipping. But it does show you what's possible.

That Sharp will make the Mk3 with DTMF seem like a bargain. That is, if Mk3 gets DTMF.

Hugs,

Della

yes, thats what I said, the driver on the cd is the weird GPS driver that does not work with the BF-U3 in Windows 7. It does work with XP.
The latest driver from prolific on their website, either the mac or windows version does not work with this interface.

b.t.w. I made a typo, Chirp does not support the BF-U3 currently, I can program the UV-3R now using Chirp on the mac.

Gerrit.

When I received my UV-3R, the drivers didn"t work on my Windows 7 (32bits).
Thanks to google, I foun the info that drivers for Vista from Wouxun working well under Vista/7 with the usb cable interface
And this is what I'm using, first with the old BF program version and now with the UV3R software v1.09

I of course may ulpload/send the driver file to everyone who would like to try it (I don't remember where I orginaly found it)

In my opinion, this radio is not designed to be used with interchangeable battery packs. It's a fiddle to chAnge the battery if the belt clip is in place. In the course of replacing the battery my 3R decided to reset itself to the factory defaults. No such hassles using the side charging socket.

I find this highly unlikely.

I've handled an original UV-3R, a black Mark II, and a yellow Mark II. Both of the Mark II's were obtained from 409Shop. I could not detect any significant difference in weight, feel, or fit-and-finish.

As for quality... all of the signal reports I've gotten back from others have been good on the 409Shop units, and I've dropped my yellow Mark II at least five times onto concrete from various heights and it's still working (I stupidly kept trying to hang it from a wide nylon lanyard with the belt clip; next time I will use a different method of attachment).

I think the person who posted the info about the 409 shop was only talking about the very inexpensive replacement displays that they are selling and not the UV-3R unit(s) them selves...
I originally read it them same ways as you and thought...how can you bootleg something so cheap already...if the displays are seconds or made at a different factory they may be substandard to the display in the UV-3R....I'm sure someone will get one in soon and have a report on the displays quality.
The 409 shop has been a good retailer...i have bought 2 radios and some accessories and all has been good with everything and shipping is approximately 7-10 days which is awesome coming from China.

Just a guess, but the spare parts could be from returned radios. Just from the experience of this group, I should think 409 shop has had to replace many faulty radios and it's probably more cost effective to break them for spares than repair them.

I would certainly hope not!
Why would a major retailer chance tarnishing it's reputation by selling used parts?
The circuit board or display if defective could not be sold as new, nor could scratched cases, displays, or the rubber parts.

I'm sure that any major retaler has an arangment with the manufacturer to return non repairable units back to them.
This is standard procedure.

Regards,
Jake

Ah, hmmm, well, er, dangit! Fiddlesticks! Sounds like user settings are stored in volatile ram. How about if I have DC going in the side when I swap out the battery? Sorta like plugging a 12vt source into the auto's cig-lighter when pulling out the type 24 800cca? Regardless, thanks for the heads up. If Lee left any ice cream, it's all yours.
Hugs,
Della

I have not encountered this problem with the unit....it seems easy enough to change the battery and the memories stay intact during the change. I would be surprised if the memories were store in volatile storage since I have radios that are much much older in their design and this has not been an issue for some time...even the ones that did like the HTX 202 had a lithium battery back up. The HTX 202 when released by radio shack was already an older design similar to the an older model ICOM handheld... I have had scanners and mobile radios off and not connected to power for a few years and they come right back on to the last place they were set to...I don't think the UV-3R is taking that step backwards in memory management.

Ah, hmmm, well, er, dangit! Fiddlesticks! Sounds like user settings are stored in volatile ram. How about if I have DC going in the side when I swap out the battery? Sorta like plugging a 12vt source into the auto's cig-lighter when pulling out the type 24 800cca?

Regardless, thanks for the heads up. If Lee left any ice cream, it's all yours.

Hugs,

Della

The important detail is that when the manual says F+Dial it means:

1) Press F, then release F
2) Use the dial.
3) Press F again to go back to slow tuning mode

Pressing and holding F is what turns on the Alarm.

I worked for an OEM of a sophisticated electronic product and our warranty specified a “replacement part” if a repair was needed. That covers a lot of territory. As a field tech I used to feel bad putting in a refurbished pcb even though the customer didn’t know it. It just didn’t seem right but was within the scope of the warranty terms.

As far as the 409 shop they might also buy in sufficient quantity to disassemble new radios and sell those parts.

I would certainly hope not!
Why would a major retailer chance tarnishing it's reputation by selling used parts?
The circuit board or display if defective could not be sold as new, nor could scratched cases, displays, or the rubber parts.

I'm sure that any major retaler has an arangment with the manufacuer to return non repairable units back to them. This is standard procedure.

Regards,
Jake

Another thought after sending my first reply...when I was employed by IBM we did field service for a number of PC manufacturers and low cost items were just disposed of. The manufacturer didn’t want to pay to have them returned due to their low manufacturing cost and not being worth anything to them.

If I may jump in here (and it appears that I already have! 8-)), my unit keeps all its prams
together between bat changes. As for charging, I've powered up the "charging stand" battery holder thing with an old Heath +0-5VDC variable power supply, which I set to ~.9C/1000 mA or ~3.9VDC for a couple of hours, figuring my smarts must be about as good as the seemingly Flintstone regulation provided by the designers. Can't seem to get the battery to read over 3.7VDC on powerup, or 2 bars/3 on the digidisplay. But carrying a spare bat adds some comfort to the situation. I hesitate to lay on more volts, since the charging current goes over the top, and the harleyguy threatened me with death over it! 8-)

I bought this li'l thing to replace my IC-02AT, which even buying a new pair of NiMH bats didn't seem to revive from its weird Rx audio problems. ~$90 for no joy vs <$50 for pure performance is a no-brainer. There's a certain fascination in seeing how low you can go, eh what? Since my 02 is unfixable (at least by me) I thought I might try a BIC! 8-)
cheers,

My early model wall charger is rated at 5 volts 1000mA. I checked it and it current limits at just over 900mA. With it current limiting at this level and the internal cutoff within the battery means it fully charges the supplied battery successfully with the battery insertedd in the charging cup. Obviously if you use devices other than those supplied with the radio then you should confirm there is current limiting within the device you choose to use. I don't have a problem using the factory supplied system.

Grant, ZL2BK.

I'm the one who started this tread and some are already turning it into a political platform, geeezzz!!!

First of all, I want to thank those who sent me private emails pointing me in the right direction. All indicate the very same website, so I will steer that way and see how it goes.

Then this, Nobody is FORCING me to spend anything. On the contrary, the school decided to help the students by buying the radios. Purchasing the radios for them is NOT part of the course. The principal very kindly offered to purchase them, but THROUGHOUT the country, school districts can only write purchase orders for USA-only businesses because they are local tax dollars. Ebay and those online places are forbidden businesses for just about any school district in the country.

Thank you all, and please, let's put this now to rest.

Well, I haven't said very much here in this group, and will continue to read and enjoy what is posted, but, for what it's worth, from a guy with over 35 years experience in thermoplastic injection molding, trust me on this one, there is absolutely no way that anyone, in China or anywhere else, would anyone bother to replicate current production tooling to manufacture counterfeit parts for what is one of the cheapest little dual band HTs on the surface of the planet. If nobody has bothered to build tooling to make knock-off E-71 BMW dashboards and center consoles, just for example, they sure as heck aren't going to bother to try to eek out a profit by making replacement molded parts for a rig that costs less than $50 US..... period.

The crystal styrene or acrylic LCD cover, belt clip, battery cover all cost literally pennies to produce. I for one would be surprised if the manufacturer has more than $2 total in ALL of the molded parts per a single complete unit combined. Simply put, counterfeiting replacement parts, or even complete functional units of such a low cost / minimal profit item simply are not going to happen. The manufacturer makes his profit by flooding the market with his product.

In my perception of things such as this, or the cost of Tupperware, or Rubbermaid trash cans or a replacement belt clip for a Yaesu VX-3R, my question to myself is usually along the lines of, "Why the hell is this crap so expensive!" Yes, real life and the cost of retail normally drives the price of the items we feel we must fill our lives with, but, when you work on the 'inside' in an industry that is effected by things such as this, sometimes all you can do is shake your head and walk away when some sap starts bragging about only having to pay $10 for a replacement belt clip for some overpriced hammy toy.

Counterfeit? Oh really? Geez, just think about it people. Remember, counterfeiters, of any bent or variety are in the business of churning a quick buck, at minimal cost and do it all at the expense of others. Yeah, counterfeit parts, for a radio that sells for less than $50..... delivered..... to the US..... from a dealer in Hong Kong?!?! Geez, gimme a break.....

I continue to do research on this DTMF project. Why does one of these cost so much? Well, here's a link to about 200 lines of logic to do the functions people want from DTMF: http://avtanski.net/projects/phone_dialer/HandheldDialer.asm

I have found a $10 kit, but reading the fine print it doesn't come with (a) power source, (b) speaker, or (c) keypad. Not any keypad ripped from a broken cell phone will work. Supposedly, a nine-pin pad is required (8 for the 4rows x 4cols, 1 for common).

The homebrew dialers I've found are twice the size and weight of UV-3R (but then they were built around the turn of the century). I did locate a nice schematic for DIY, but instead of a keypad there was a set of DIP switches. "Move sw2 and sw7 to play a zero..." - naw, not my style. Sometimes one-press-lazy is a good idea.

I'd settle for a dinky keyboard, mini-circuit w/10 memories, and a pizeo speaker all glued to a 9vt battery. It sure would be nice if that didn't cost more than the UV-3R.

Hugs,
Della

3140. UV-3R battery ingenuity

Yahoo group: UV-3R (2011)
Date: 2011-11-11 19:38:20 UTC
From: k5egg
Topic: 3140 Message: 3140

I picked up a UV-3R from Wouxun.us with a 'DOA' battery. Darned thing just wouldn't charge after 24 hours. Instead of doing my normal routine in this situation (cry to the reseller), I spotted an old Nokia 1112 GSM handset (Tracfone) which happened to be collecting dust on my desk, and noticed it didn't just fit - but it fit really well! The contacts, of course, did not match.

To work around the contact issue, I soldered 1.5 inch long (or so) 24 awg solid wires (insulated, from cat5) to the battery's terminals. Since the battery 'snaps in' snugly, the radio's battery "prongs" were very snug in their insulated openings. This traps the wires quite successfully and seems to provide plenty of current to the radio without heating.

I did cover the soldered contacts on the battery with electrical tape. You *DO NOT* want the battery to short against the metal housing!

The Nokia battery is slightly thinner than the original, in both thickness and width (and slightly less rated capacity) and it would 'pop out' of the UV-3R and come disconnected when dropped. I was able to fix this with a piece of thin cardboard between the battery and the battery cover.

End result is, with the Nokia BL-5CA battery, I get well over 36 hours standby, or >10 hours of heavy use w/ backlight on. Charging seems normal, there is no cell heating.

I've now used this a month and at least a dozen charge cycles, no problems.

I have since noticed that many 'standard' cellular and camera lithium ion batteries will fit similarly in this radio, and (should) would work fine using the same technique.

They say a picture says a thousand words:

I did cover the soldered contacts on the battery with electrical tape. You *DO NOT* want the battery to short against the metal housing!

The Nokia battery is slightly thinner than the original, in both thickness and width (and slightly less rated capacity) and it would 'pop out' of the UV-3R and come disconnected when dropped. I was able to fix this with a piece of thin cardboard between the battery and the battery cover.

End result is, with the Nokia BL-5CA battery, I get well over 36 hours standby, or >10 hours of heavy use w/ backlight on. Charging seems normal, there is no cell heating.

I've now used this a month and at least a dozen charge cycles, no problems.

I have since noticed that many 'standard' cellular and camera lithium ion batteries will fit similarly in this radio, and (should) would work fine using the same technique.

They say a picture says a thousand words:

3142. Display Replacement UV3R

Yahoo group: UV-3R (2011)
Date: 2011-11-12 01:24:22 UTC
From: PaulG
Topic: 3142 Message: 3142

I just ordered a replacement display for a UV3R from 209shop. So I should be able to compare them soon.

Has anyone tried to replace a display on one of these radios? How are they installed? I hope it is something I can try with my Hakko 808 desoldering iron.

Carrying these small radios in a back pocket is probably not the best idea!

Actually, in the US, FM is defined with 2-tenths MHz separation, going on the odd numbers (98.1 98.3 98.5 98.7 98.9 91.1). When we push buttons to move up or down, most consumer receivers don't give you a one-tenths MHz choice, just a two-tenths MHz choice.
I miss the days of analog tuning. Except when I want to pop to the other end of the "dial", of course.
Hugs,
Della

On the other hand, my FT-817ND tunes FM in .05 steps, so six clicks on the tuner knob cover the same station without improving the reception. I've always considered that unnecessarily discriminating on a band that is rather stable and well-regulated. Are you looking for signals tucked in between two adjacent stations?
Hugs,
Della

No soldering iron required.

There is a small holding bar with two screws.

Unscrew them and lift the display off of the contacts underneath.

Try not to touch the conductive rubber connector on the display.

It's a very easy job on reality. It should only take a few minutes.

Radio Shack made 2 "Pocket Tone Dialer"s the 43-139 and the 43-141 which has 32 memories. I picked up one of each at a flea market and the other at a ham fest for $1 each. I used them with my FT-817 before I got the DTMF mic and they worked pretty good.

YMMV on finding one but I recommend grabbing it if you do.

Buying the cheapest, saves the American consumer with more money in our pockets, which is #1.

Like the myth/lie about American cars (as well as appliances, phone companies, bank customer support, etc.), which are not and have not been American for decades as they too are built with foreign parts or across the border in Mexico or Canada with just the profits stuffing the pockets of American corporations who are even further bailed-out with wasted taxpayer money.

American business have off-shored, outsourced, laid-off, deserted American slaves and then buy cheap foreign parts and labor.

It's time for American consumers to save and serve their ass the same way.

Do you mean those similar to what police use on the shoulder on movies ? :)
I have one of those, came with uv3R. Made in taiwan (?).
Receive audio is quite good, but I've been told my voice sounds like I'm talking with a couple blankets over my head :)
Maybe that'se because the mic hole is quite small and is not centered with the mic sensor inside.
I opened mine and enlarged it with a small knife.
Apparently the audio got better to people receiving my voice.

The cord is stiff, meaning, if you pull it from both ends, it Will not retain the new longer form.

Also, the first time I connected it, it locked on transmit. Turned the plug around a bit, took it out and back in, and it never happened again.

Nuno

Hello Della ,

Yes right.
This is to adjust to interspace stations between 65-88Mhz range, to have more resolution.

Regards

Check eBay for real or fake VX-3 cases.

As others have noted, you will have to remove some material from the
top center so the case can clear the post the holds the belt clip.
Check the photo section of the group's webpage for details.

One other Nice thing about it is the rotating clip on the back, so you can hold the mic any way / where you want. This is very handy.
It also feels robust.

Please check 409 shop as they sell a model that allows connecting an earpiece.

Mine does not.
I can post later my speaker-mic model and maybe some pics.

To open it (before enlarging mic hole) you need a Philips screw driver and one other (don't know the english word for it, but its tip has 6 sides)

Rotating clip I knew about. Earphone jack I did not. There are also models with volume control. I will look for models with jack and vol control. Thank you!

Bits you are talking about are "hex" and "torx". "Hex" has six flat sides, "Torx" has six fin-like sides. "Torx" will fit in Hex hole. "Hex" will not fit in Torx hole. Each bit is otherwise sized in equivalent dimensions (Inches or Metric).

Hugs,
Della

3167. Blinking TX LED

Yahoo group: UV-3R (2011)
Date: 2011-11-13 06:18:23 UTC
From: ironmask55
Topic: 3167 Message: 3167

I just got a uv-3r. Today it started doing something strange. When I turn it on, the TX led seems to turn Orange. Though it does not seem to be transmitting. I put it in scan, and it stays orange. After about 10 seconds, it starts blinking.If I touch any button it stops blinking, but stay lit. After 10 seconds, starts blinking again. If I hit Monitor, it stays orange. Stays orange when receiving (it used to be green when Receiving)

I dont THINK I changed any settings that would have done that.

Anyone have any idea whats going on?

Thanks
Joe

Hi Thierry. How loud is the audio coming out of the speaker-mic compared to the normal rig loudspeaker?

I guess if it is still too loud there would be room in the speaker-mic to put in a resistor or a volume control to reduce the level. ;)

That was my first guess. Charged up it up and the light is still on. Tried a reset too. No luck.

I will say that it is only 25% the audio of the rig loudspeaker.

A few minutes ago I've just notice something weird using this speaker-mic: when the squelch is open, it is nearly impossible to have the uv-3r transmitting when pressing the mic ptt ! It is hard for me to describe the phenomenon, even more with my bad english... I will say it's like if the ptt will be not "enough pressed" and produced some kind of RF interference...
With squelch at 1 minimum, this problem disappear totally and pressing gently the ptt toggle the uv-3r without any problem and audio is perfectly received clear in my yupitery scanner.

The US economy is weakened because the import duties are not paid. Not sure what role the US Post office plays in this but the shipping has to cost near $20. (there is no such thing as free shipping).

IF you buy from a US distributor the duties are paid (maybe). And maybe you get better service.

Of course just about everything electronic is made in china, co there is no way to avoid them getting the money and if they make the product they deserve the cash.

A US owned company normally spends more money here than overseas but that is outside of this discussion and should not be in the scope of this group.

Pay now or down the road real soon...

The US economy is weakened because of corporate off-shoring, outsourcing, overseas manufacturing, destruction of labor unions, technology replacing manual labor all leading to US unemployment.

It's time for the consumer to do as businesses do, look-out for their own asses and buy the cheapest, no matter what country it comes from.

From: Nuno Xavier
Topic: 3155 Message: 3174

"Bits you are talking about are "hex" and "torx". "Hex" has six flat sides, "Torx" has six fin-like sides. "Torx" will fit in Hex hole. "Hex" will not fit in Torx hole. Each bit is otherwise sized in equivalent dimensions (Inches or Metric)."

Della, thank for the explanation on the bits names.
In Portugal we call it "chave" (key/ screwdriver) "sextavada", meaning it has 6 sides. "Hex" comes from greek "*héks*" and also means 6.

3176. Two related questions

Yahoo group: UV-3R (2011)
Date: 2011-11-13 19:01:11 UTC
From: Pete Snidal
Topic: 3176 Message: 3176

Greetings, all! I have two related questions.
First, there is a relatively new tracking system in uhf/vhf amateur radio. New radios incorporating this system report their qth regularly through a digipeater system. If there's a digipeater in the system within range, said dp passes on the data upstream to the system. The idea is that there's a central database somewhere, constantly being updated, with a website available that will give access to the database, so any given ham with such a radio can be located at any time. (Like when WB6uh-oh is parked for 3 hours at his girlfriend's house, and his XYL - or her lawyer - or his private eye - knows how to access the data)

Sounds pretty friggin' Big Brother to me! But our local ham club was approached by some hams from elsewhere who requested that we allow them to install a "free" digipeater in one of our mountaintop shacks to take part in this marvelous new piece of technology, and of course the agreement was almost universal. Personally, I hated the idea, but got the usual Conspiracy Theorist eye-rolling and guffaws and such, and it went through fb.

My concern ended when I found out that any radios you're using have to be equipped with the always-on subliminal locating and transmitting system if you're going to be one of the lucky hams to take part. All _I_ had to do to protect my privacy - what little there is left of it (see google earth, yahoo maps, etc.) was just not to use any new radios. And then along came the death of my trusty IC02AT and a search for a replacement. Enter Baofeng.

I can't remember the achronym for the system. LFRS or some such combo. But here's my second question: do our UV-3Rs have this thing in them? I'd hope not, them being so low-dollar, and thinking this may be a "feature" for the "top end" stuff. But I'd like to be sure. If not, I'll have to get rid of the thing and try to get my old IC02-AT fixed. If I want Big Sister to know my whereabouts, I'll drop her a dime on the landline!

tnx,
ps

It's called APRS. My VX-8GR has it. It's pretty cool. AND, it's very easy to turn off so you don't transmit your location.

Like N7LN said, that's APRS. It's not running all the time, only when you want it to be. It uses packet so if you know what that sounds like you can hear it on the radio. Listen to 144.390 sometime. It only works because someone hooks a GPS up to a packet TNC and then a radio. One or two newer radios, like the VX-8GR has all that built in so all you have to do is turn it on and let it run on the APRS frequency. It's not pervasive tracking. And there are very very few radios with it built in to that point. The digipeater is so people in the area can have their location repeated to an igate that will get it on the Internet.

No conspiracy theories needed if you understand the system enough.

And NO, the UV-3R does not have built-in APRS. However, I'm hoping to integrate a TinyTrak4 with a GPS and the UV-3R to make a very compact 5v-powered tracking system. Add a Bluetooth to serial adapter to the TT4, and I'll have a portable IGate when paired with APRSISCE on my cellphone.

If you're worried about "big brother", then I trust that you don't own a cell phone? The phone company knows the approximate location of your phone at all times compliments of triangulation of your phone's particular ID hitting multiple towers at the same time. And how many of us turn our phones completely off? Ever?

Lynn (D) - KJ4ERJ - Author of APRSISCE for Windows Mobile and Win32

If we really want to hit the paranoia and black helicopter button, anytime you transmit on any HT you can be located. There are systems that can locate a transmitter as soon as they key up. The US Coast Guard uses such a system on the marine FM frequencies, it's called Rescue 21. If a person gives a false distress call, the Coast Guard can triangulate the transmission and see if the call actually came from a ship in the water or possibly some kids playing with a radio on land. The USCG has installed equipment at strategic locations on high towers to achieve this.

Too many HT's so I'm selling a Baofeng UV3R Mark 1. Includes both the black case as well as the camo case. Swapping is a simple 2 minute job. Charger included. Pristine condition. $50 plus your choice of shipping.
Wouxun KG-UV2D is also pristine. Includes the separate AA battery case and the charger. $95 plus shipping. Email w8aqjack@....

There's a memory chip in the marine radio. The radio is programed to transmits boat call/ name and position. A UV-3R doesn't have that chip: info in it.
The marine radio can be picked by Satellite, radio towers, and other ships.

Don VA7DGP

I do have a marine restricted radio operator license for Canada.

The radio must have a GPS in it like the Kenwood and Icom Mic and a TNC Transmitting on 144.390 I think. If you have high dollar equipment in car. It's not a bad idea to be able to find car if stolen.

That is if you have a DSC (Digital Selective Calling) radio that has an MMSI (Maritime Mobile Service Identity) programmed into it. "DSC radio signal transmits vital vessel information, position, and the nature of distress (if entered) at the push of a button."

Older Marine radios cans still be located via triangulation from the Rescue21 base receiver installations. They do not need the chip.

Yes, that's true. It's still like finding a needle in a hat stack
A 2 watt signal on a lake or ocean maybe be picked up but if signal is walked on by a stronger signal. That's why we here " selonce mayday " I'm going to have to re read my Marine Radio Hand book. If you don't use it, you loose it.

There is value added in buying from an American distributor, namely service. With a radio at this price I'd be unlikely to send it back to China for repair or replacement, but I would send it to North Carolina or elsewhere in the states. The ability to do that is of value to me, thus why I bought both my UV-3R Mark II radios and one Wouxun radio from wouxun.us, fully knowing I could get them cheaper in Hong Kong.

It's cheaper to buy a new one from Hong Kong and have it shipped to you in USA, than to get a defective one fixed and pay to ship it within USA.

Thanks to great prices from Hong Kong & China, they're practically disposable at their superior price-point and value.

From: dellaaxim
Topic: 3176 Message: 3195

I have several related answers. I'm not intending to pop anybody's bubble, but it shoud be taken into serious consideration that civilian GPS (L1 freq) is easily defeated by car thieves, oblitering the warm-n-fuzzy feeling of "turning on Lo-Jak and find my gear". A $15 (shipping included) eBay "gps blocker" in a 12v source automatically captures the gps unit's attention and sends totally confusing signals to it.

It's kinda funny when Stephanie keeps saying "Calculating Route" and tells you to turn left on a street in another state. Then another state. Then another state.

Yeah, the "blockers" work. Well, for mere civilians anyway. L2-L5 (non-civilian gps freqs) are not touched. So *your* gps system will go crazy, but the one stuck to your bumper by Big Brother (or anybody's taped to the trailer you're pulling (which is out of the max blocking range of 10ft) will still do its job.

While we're putting on our aluminum caps, also keep in mind that for most new phones any feature can be activated remotely even when the phone is turned "off" (and for a select few phones, even with the battery out). In some phones, it's the very battery that's smart!

Not having that "ability" can be a blessing if you want to be alone.

But wait, it gets stranger still. Suitcase cell towers are rapidly becoming the LEO rage. Folks, they're priced down in "local Sheriff's budget" range, and with The Supremes deciding that cell phones are just radios xmitting over public airwaves, your calls and call history are not protected the moment you broadcast. That's also the Ham rules set up by the FCC. The suitcases suck up all the phone calls over a surprisingly large sphere of spacial influence into a honey bucket, storing all the contents of all the phones, including a list of numbers previously called, phone book, SMS history, and of course the id of each phone which traces directly to purchase and registration papers. You did, of course, fill out that warranty card fully and truthfully, and purchased with your very own credit card, yes?

Suitcases can handle 100s of simultaneous calls, acting as repeater for a select list (911 and the working team's numbers, for instance) to make sure "important" calls reach an actual network.

UV-3R Mk1-2 is blessedly devoid of most modern-day cell "features." It can't even do DTMR, so can't make phone calls (grin). I call it "PORS" (Plain Old Radio Service).

Hugs,
Della

Oh, Dan, it sounds like you purchased a made-in-China radio from a US distributor at a higher price just so you could pay more to get it fixed than it costs to purchase a new radio from China. Where did you purchase your made-in-Thailand disk drive? Your made-in-Honduras shirt? The labor cost in the US to fix either of those is wildly more than purchasing a new one, mostly because very few people in the USA know how to fix 'em, and the few that do can charge wild prices.

School boards who dictate "purchase in America" just add a layer of middlemen *who add no value to products that cannot be repaired cheaper than they can be repurchased*. eBay does the "distributing" for free. Sadly, we taxpayers are saddled with increasing costs that do nothing to educate our kids.

And the sad fact of the matter is, unions are pricing their members right out of the world global market with their "Occupy Our Employers" philosophy.

When xmitting radios were truly repairable, only the very wealthy or very dedicated could afford them. Unions made sure the repair staff would not be tucked into a closet repairing 24/7/365 by candle light. Now that great radios are disposable, *anybody* can afford them. Cell phones are even FREE! How much more progressive could that be? Blessed be disposable UV-3R!

Hugs,
Della

Look, this will at first sound like a stab in the dark, but from an engineer's point of view, you are getting an "important technical message, please pay attention." Engineers tend to think alike when it comes to communicating error situations, and tend to give out very similar grunt-like cryptic messages.

This from the Dell site:

"If the [power] light is blinking amber ☐ The computer is receiving electrical power, but an internal power problem might exist."

Your battery might in fact be faulty. It sounds like it can hold voltage, but not deliver the amps for XMIT. Try another known-working battery. Repowering a faulty battery will not bring joy.

Be happy that the screen did not read "PUNT" as did an error message I had to track down in 1979. Research uncovered that the engineer was never told what to do under a certain failure situation, but at least she conjured up a message for the operator.

Hugs,
Della

I just picked up a new SHARP EL-6250 for $19/shipped on Amazon.
But I'm pretty sure it won't do ABCD tones, just 0-0,*# (3x4, not 4x4).

There's a Brit company making a 4x4 kit, selling on eBay. It looks sweet, but still goes over US$60.

"Well, Dad, it was hardly anything for my UV-3R Mk2's, but I've spent several hundred in essential accessories."

"How do you pay for all this stuff?"

"I skip lunch. Do you have any idea how much lunch costs nowadays?"

Hugs,
Della

From: gm4cid
Topic: 3205 Message: 3205

I notice that in the technical correspondence page of QST December 2011 Bob Allison WB1GCM ARRL Lab Test Engineer shows measured 2 m second harmonic on two tested samples of UV-3R and comments.. quote...

"To legally transmit with these radios in the 2 m band, you would have to add a second harmonic low-pass filter at the antenna jack."

Valid when connected to an external antenna!

But how can this be done when using the radio in hand-held mode?

Perhaps it would have been meaningful to have measured the radiated second harmonic taking into account the effect of the supplied screw in antenna.

Bob GM4CID

I interpreted this article as a warning not to use the Baofeng. I thought it was interesting that this article was treated as a "Stray" instead of as a Product Review.

On a visit to CT last month, it sounds like the UV-3R is as popular there as anywhere.

I was told that Lentini Communications, a local radio store located 10-15 mi from ARRL HQ, cannot keep the Baofeng in stock.

I emailed him asking the same thing. I forgot to ask him if it was alright to send this reply on to this list. I think it turns out the antenna only adds 6 db of harmonic suppression. They didn't do the test in a room designed for such over the air tests so it could be off by a db or two. He said FCC Part97 rules state that the measurement is to be done at the antenna connection to be right. I also shared a link to the lpf mod.

I have to take exception. Let me explain my subjective position on the use of "technical" forums as they have evolved on the internet.

We are not writing a joint technical manual (although techical details do appear from time to time).

We are discussing UV-3R's acquisition, use, features (or lack thereof), for two current versions, how the UV-3R became that way, what might happen to UV-3R in the future, and how UV-3R relates to other radios and (most importantly) our lives in general. If it didn't affect my life, I wouldn't be on this forum. I'd just do a web search, filter the answers, and go away without asking questions or challenging data.

All of this forum is most relevant conversation to UV-3R specifically. That, of course, is an opinion that differs from yours, but I'd like to think you would consider my point of view.

Humans are social creatures, so the social impact of UV-3R is relevant. Otherwise, this entire forum would be about 30 messages long, an appendix to the technical details of the UV-3R. Basically, you can already read the database, files, and photos and get 99% of "All There Is To Know" about UV-3R.

Most of the UV-3R freqs are licensed use bands, and therefore HAMs and GMRS and even MURS will weave quite the fabric of conversation over this effective little box and how it specifically will affect our lives (and, being inexpensive, specifically how it will attract thousands of new hobbiests onto the already-crowded airwaves, and what specific impact that will have on band pileups).

Most certainly, a whole lot of this forum's conversations will be subjective and opinionated (the very nature of discussion, as opposed to technical manuals), covering stuff that is seldom placed in technical manuals, such as what mods to make (or not), and why, and where best to purchase, upgrade, and repair. TThere even are valid discussions on *color* of case, a totally subjective discussion that disregards the use or performance of this little box.

Yes, flames are a bother, so do play fair. But heat is necessary to cook a nice meal. Something very unusual is going on in the HAM kitchen. In 2011, HAM seems to have gone viral, with more licenses being issued faster than ever in history. And HAM radios are selling faster than CB's ever did.

Now, reading back, doesn't this posting reflect on UV-3R specifically?

Hugs (or do the rules of conversation still insist I say "73"?),
Della

Subject: [UV-3R] Re: Two related questions

I have several related answers. I'm not intending to pop anybody's bubble, but it shoud be taken into serious consideration that civilian GPS (L1 freq) is easily defeated by car thieves, oblitering the warm-n-fuzzy feeling of "turning on Lo-Jak and find my gear". A $15 (shipping included) eBay "gps blocker" in a 12v source automatically captures the gps unit's attention and sends totally confusing signals to it.

It's kinda funny when Stephanie keeps saying "Calculating Route" and tells you to turn left on a street in another state. Then another state. Then another state.

Yeah, the "blockers" work. Well, for mere civilians anyway. L2-L5 (non-civilian gps freqs) are not touched. So *your* gps system will go crazy, but the one stuck to your bumper by Big Brother (or anybody's taped to the trailer you're pulling (which is out of the max blocking range of 10ft) will still do its job.

While we're putting on our aluminum caps, also keep in mind that for most new phones any feature can be activated remotely even when the phone is turned "off" (and for a select few phones, even with the battery out). In some phones, it's the very battery that's smart!

Not having that "ability" can be a blessing if you want to be alone.

But wait, it gets stranger still. Suitcase cell towers are rapidly becoming the LEO rage. Folks, they're priced down in "local Sheriff's budget" range, and with The Supremes deciding that cell phones are just radios xmitting over public airwaves, your calls and call history are not protected the moment you broadcast. That's also the Ham rules set up by the FCC. The suitcases suck up all the phone calls over a surprisingly large sphere of spacial influence into a honey bucket, storing all the contents of all the phones, including a list of numbers previously called, phone book, SMS history, and of course the id of each phone which traces directly to purchase and registration papers. You did, of course, fill out that warranty card fully and truthfully, and purchased with your very own credit card, yes?

Suitcases can handle 100s of simultaneous calls, acting as repeater for a select list (911 and the working team's numbers, for instance) to make sure "important" calls reach an actual network.

UV-3R Mk1-2 is blessedly devoid of most modern-day cell "features." It can't even do DTMR, so can't make phone calls (grin). I call it "PORS" (Plain Old Radio Service).

Hugs,
Della

It probably has to do with one of your menu settings... Number 18 "BCLO". If #18 is set to "ON" and the squelch is open (even if it is just noise) the transmitter will not engage. This is an annoying feature if a repeater has a long hang time after the other station stops talking.... Turn this feature OFF and you can talk with the squelch open...

John KB0NE

> A few minutes ago I've just notice something weird using this speaker-mic: when the squelch is open, it is nearly impossible to have the uv-3r transmitting when pressing the mic ptt !
> It is hard for me to describe the phenomenon, even more with my bad english... I will say it's like if the ptt will be not "enough pressed" and produced some kind of RF interference...
> With squelch at 1 minimum, this problem disappear totally and pressing gently the ptt toggle the uv-3r without any problem and audio is perfectly received clear in my yupitery scanner.

I was playing with my spectrum analyzer today and decided to do a very informal and somewhat unscientific test of the UV3R.

I set the frequency on the UV3R to 146MHz and placed the HT about 4 feet away from the spectrum analyzer that had a short antenna on it. The second harmonic was only about 30 dB down from the primary signal, not good. I did the identical test with a Wouxun KG-UVD1P and a Yaesu VX-7R and saw no discernible signal at the harmonic frequency. Looks like this is a very dirty HT.

I posted the sweep in the FILES SECTION.

Please read the FAQ and the Files section. There are photos, spectrum scans, and links to how to fix the LPF with a single capacitor inside the radio.

Or google for wa5znu baofeng lpf for my article, though I am *not* the originator of the solution...all I did was show how to do it with SMT parts.

From: dellaaxim
Topic: 3155 Message: 3222

Well, I can't hijak my own thread. As Sgt Joe Friday would say, "Facts, ma'am, just the facts." eBay radioshop888 sells a Speaker Mic with adjustable volume and external jack. I'm not sure if the PTT earbud/inline mic works when plugged into the Speaker Mic. I'll try it when they arrive, not postulate here. I do appreciate the subjective non-technical comments and photos posted to this discussion - they assisted in my decision-making.

> How well does it work (key switch, sound quality)?
SUMMARY: Very functional - with some units having added feature of 3.5 jack, and others (specifically for mk2) also including mic vol control.
> Is the cord soft or stiff?
SUMMARY: Cord returns to normal coiled condition after being stretched.
ADDENDUM1: Mic hole probably needs to be enlarged by end user.
ADDENDUM2: Clip for lapel can swivel - has 8 detent stops - and appears to be robust, although the "thickness" of mic+clip is more than the "thickness" of UV-3R.

Hugs,
Della

3223. Battery charger alternative

Yahoo group: UV-3R (2011)
Date: 2011-11-15 00:42:26 UTC
From: dellaaxim
Topic: 3223 Message: 3223

FACT: Lenmar makes excellent all-in-one battery chargers.

DETAILS: Models BCUNI2 and BCUNI3. The only difference between models is that BCUNI3 has a USB power output port, and an LCD screen for those who don't like decoding blinking blue lights for charging status, red light for error messages, and are willing to pay the extra price for pictograms.

FUNCTIONS:
1. Will charge LiIon, NiCd, NiMH, cylindrical or rectangular shapes in voltages 1.2 2.4 3.6 4.8 6.0 7.2
2. Figures out which voltage by itself (no, it's not just two wires and a prayer).
3. Adjustable contacts (width and depth) so you can set for nearly any battery configuration, including one cell or two. Of course, this introduces operator error when the alignment of the two contacts are *not* properly adjusted, so this item does have a "fiddle-factor".
4. Comes with 100-240v AC and 12v DC power sources, with an adaptor for non-NorthAmerican power.
5. Compact, with no prongs to snag or way to ruin the contacts while travelling.
6. Extraordinaryly readable and useful instructions that are compact enough to take with the charger when travelling.
7. Draws up to 1000mA, output up to 1000mA (incl USB).
8. Max hr timing protection (7hr LiIon) (6hr NiCd/NiMh)
9. Charge termination when exceeding 130mA (LiIon)
10. Fault indication
11. One-year warranty
12. BCUNI2<US$20 delivered, BCUNI3<US$25 delivered as of this posting.

OBSERVATIONS:
Apparently there is some sort of possibility of lead contamination by handling power cords, or so the Manteel Environmental Justice Foundation managed to get determined by California courts, so there is also a Proposition 65 Notice telling Californian's to wash their hands after handling cords. Else you might give your unborn child a birth defect. Not that *this* cord has lead, but sometime somewhere some cords had lead. Not only are there pictures and arrows describing how to drive this thing, Lenmar advises you to wash your hands after handling power cords (see bottom of page 4 in the instructions). That's how complete the instructions are for charging your battery with this unit.

The only subjective data (other then #6 above) is that I have several of these and wish I had known about them much earlier. Pretty easy part numbers to remember:
"BatteryChargerUNIt2" - no, wait, that's subjective. Oh well.

Hugs,
Della

I'm a new member to the UV-3R Yahoo Group. I'm a retired RF engineer with Motorola for 36+ years and first found out about this radio a few weeks ago because a local is involved in the manufacture of another radio (FRS) using this same interesting SDR chip. I am in the process of assisting to get the manufacturer to be aware of and correct this since it is violating both its certification and the US amateur Part 97 requirements.

I would like to know of anyone, other than Tom,PA2TSL, who have measured this harmonic on units and I want to verify the following.

A potential problem with such a measurement is distortion (overload) in the analyzer causing a higher harmonic than that generated by the radio. The easiest way to verify that the level being seen is coming only from the radio is to add input attenuation to reduce the potential of mixer overload, then increase internal gain (usually called IF gain) to set the same reference level. If the analyzer is not contributing, then the spur level remains at the same dB below the carrier. I want to verify that this was verified. The reason I ask is that there have been some numbers reported and some sources are unverified, so I just want to verify the solid sources and their numbers.

From: satellitboy
Topic: 262 Message: 3229

Hello Steve,

(This is a copy of the mail that I have send to you directly)

I am also a retired RF support engineer who has spend 34 years with Hewlett-Packard / Agilent Technologies. I was responsible for the repair and calibration of RF/microwave test and measurement equipment for quite a long time.

I can assure you that the measurements that I have made are accurate and that the spectrum analyzer front-end has not been overloaded (which may cause non-linear measurements).
The maximum input level (to the mixer of the HP 8991A analyzer) for a linear signal processing is -40 dBm.
I have inserted an external 30 dB power attenuator (HP 8498A) between the analyzer and the UV-3R, and in combination with the analyzer input attenuator setting you can obtain a signal level without overloading the analyzer's front-end.
A simple check is to increase the input attenuator with 10 dB. All displayed signals, including the (sub)harmonics, should also decrease with 10 dB. In that case you can assure yourself that no circuits are overdriven and that the measured values are valid.
Your 141T based spectrum analyzer will, of course, function in the same way.
Are you using the 8554B/L RF Section? In that case you also will have a maximum input level of -40 dBm (to the 1st mixer) so you can reproduce the measurement in the same way.

I have added some photos (to the photos section of this group) that I have made some time ago. The design problem of the VHF low-pass filter is clearly noticeable!

It really is a pity that the manufacturer has not resolved this problem. The UV-3R is a very nice handheld and it would be of much more value for us hams when this problem should have been fixed!

It would be great when you are able to convince the manufacturer's design engineers that the VHF low-pass filter needs to be modified, and that a 'work-around' for fixing the existing UV-3R's will be available.

Best regards and 73's, Tom PA2TSL

Steve,

It is gratifying to see someone pursuing this. I fear a lot of users are just saying, "so what?". But this harmonic falls in the area of the spectrum allocated to fixed, mobile, and satellite mobile. How many of us would like to have our call sign identified as interfering with these services.

I bought my unit on this past Saturday at the Montgomery AL Hamfest and have made inquiries to the vendor to see what the official line is gonna be. Needless to say, I would not have purchased the item had I been aware of this very serious harmonic problem.

> I'm a new member to the UV-3R Yahoo Group. I'm a retired Motorola RF engineer with 36+ years and first found out about this radio a few weeks ago because a local is involved in the manufacture of another radio (FRS) using this same interesting SDR chip. I have also had considerable responsibility for Certifying equipment for our FCC.
> Your post below appears to be the first on the harmonic issue. The numbers I am seeing (-30 dBc and worse) are well out of spec for both our FCC Part 97 (ham) and Part 90 (two-way) that the radio has received FCC certification for and, more alarming, they are 45 dB worse that the radio used for the official Certification data. I am assisting in getting this remedied at the source, so I want to verify any data sources I refer to.
>
> While I assume you are experienced with equipment you indicated you measured the harmonic on, I want to ask one verifying question about the setup you used. I'm not familiar with the HP 8591A, mine is an older 141T Based unit, but this is a valid question for any type.
> A potential problem with such measurements is distortion (overload) in the analyzer causing a higher harmonic value than that generated by the radio. The easiest way to verify that the level being seen is coming from the radio is to add input attenuation (your attenuator is a good sign) then increase internal gain (usually called IF gain) to set the same reference level. If the analyzer is not contributing, then the spur level remains at the same DBc. Are you familiar with this - did you verify, or check for this?
> The reason I ask is that there have been some higher and some lower numbers reported and some sources are questionable, so I just want to verify the solid sources.

Russ, I am confused by your question as my comments were not intended to be interpreted as 'a theory on how the fitting on the the handheld can cause spurious harmonics'.

While the 2nd harmonic fix is well documented in the files section there will be many who are not comfortable performing this mod.

Post modification the radio is legal for amateur use but FCC approval is no longer valid

QST statement is correct when the UV-3R is used mobile or fixed with a regular externally connected antenna.

But should the text have stated that this handheld radio can not be used as-is with the supplied rebber duck antenna?

Is it practical to connect the rubber-duck via a low pass filter and use the radio in handheld mode?

My initial thoughts were that perhaps attennuation of the second harmonic by the rubber duck antenna would give mitigating results but measurements by Joe K1IKE rule this out.

Question - should handheld radios require additionally FCC spectral testing with their supplied rubber duck antenna connected?

73 Bob GM4CID

I have found the diagram and analyzer pictures for adding 3.3pf on top of the existing caps at C135 and C136.

1. Is there a picture of where these caps are located?
2. What Physical size cap is needed?

No, I have not opened the unit yet. I was waiting until I get the parts.
This appears to be the best correction for this problem and I would like to order and install the parts. - Jerry

Hi Jerry,

1. Yes, I've created a picture showing the position of both condensers. Although most of the guys here won't be interested in such technicals, I will upload it to the board's file area.

2. You'll need 0402 SMD Caps 3,3pF C0G 50V.

Thank you John for your anwser.

BLCO is set to "OFF", so it is not related the problem.
I've juste made a rapid (and poor) video that I've uploaded on youtube but a poor video is better than a thousand poor words !
Here is the link to be able to watch it:

http://www.youtube.com/watch?v=rhYjcrTZdGQ

Doing this video, I've just noticed that on VHF, it is nearly impossible to transmit, when on UHF it is 1 / 3 time, more and less.

Thierry

It probably has to do with one of your menu settings... Number 18 "BCLO". If #18 is set to "ON" and the squelch is open (even if it is just noise) the transmitter will not engage. This is an annoying feature if a repeater has a long hang time after the other station stops talking.... Turn this feature OFF and you can talk with the squelch open...

John KB0NE

> A few minutes ago I've just notice something weird using this speaker-mic: when the squelch is open, it is nearly impossible to have the uv-3r transmitting when pressing the mic ptt !
> It is hard for me to describe the phenomenon, even more with my bad english... I will say it's like if the ptt will be not "enough pressed" and produced some kind of RF interference...
> With squelch at 1 minimum, this problem disappear totally and pressing gently the ptt toggle the uv-3r without any problem and audio is perfectly received clear in my yupitery scanner.

perhaps I don't understand harmonics as well as I should, but isn't the second harmonic for the 2M ham band, assuming a tx frequency of 146MHZ, around 584MHZ?
Absolutely nothing to interfere with around here on 580/600MHZ.
And even if there was, it would be digital or data streams where FM carrier wouldn't effect it anyway.
That is assuming that when I'm transmitting at .5W on VHF that my second harmonic would even be received beyond a few hundred meters from my transmitter, even with an exceedingly sensative receiver.
A problem I agree, but for all intents and purposes, a fairly innocuous one for most people.
I wonder if the experts on the list could give an estimate of a real world senario? If I was transmitting on the UV3R on VHF with 2W or so, how far away could a typical real world receiver hear the second harmonic? I know, that isn't the point, but I'm just curious as to what real effect this problem has in the real everyday world.
You can bandy graphs and charts around allot, and test in controlled conditions, but how does this effect the average user of the UV3R?
Considering no one would transmit without an antenna on the radio anyway, the problem seems to be a moot point.
I guess if your a stickler for FCC regulations and follow those to the letter, it's an issue...or regulations of whatever governing agency in your own country. But, I'm sure any of us who drive have exceeded the speed limit while driving and not thought twice about it if the conditions and situation were not going to harm anyone.

Subject: [UV-3R] Re: Serious harmonics problem on VHF!

Hello Steve,

(This is a copy of the mail that I have send to you directly)

I am also a retired RF support engineer who has spend 34 years with Hewlett-Packard / Agilent Technologies. I was responsible for the repair and calibration of RF/microwave test and measurement equipment for quite a long time.

I can assure you that the measurements that I have made are accurate and that the spectrum analyzer front-end has not been overloaded (which may cause non-linear measurements).
The maximum input level (to the mixer of the HP 8991A analyzer) for a linear signal processing is -40 dBm.
I have inserted an external 30 dB power attenuator (HP 8498A) between the analyzer and the UV-3R, and in combination with the analyzer input attenuator setting you can obtain a signal level without overloading the analyzer's front-end.

A simple check is to increase the input attenuator with 10 dB. All displayed signals, including the (sub)harmonics, should also decrease with 10 dB. In that case you can assure yourself that no circuits are overdriven and that the measured values are valid.
Your 141T based spectrum analyzer will, of course, function in the same way.
Are you using the 8554B/L RF Section? In that case you also will have a maximum input level of -40 dBm (to the 1st mixer) so you can reproduce the measurement in the same way.

I have added some photos (to the photos section of this group) that I have made some time ago. The design problem of the VHF low-pass filter is clearly noticeable!

It really is a pity that the manufacturer has not resolved this problem. The UV-3R is a very nice handheld and it would be of much more value for us hams when this problem should have been fixed!

It would be great when you are able to convince the manufacturer's design engineers that the VHF low-pass filter needs to be modified, and that a 'work-around' for fixing the existing UV-3R's will be available.

Best regards and 73's, Tom PA2TSL

That'd be the 4th harmonic.
Here's a fun experiment, put a receiver on 438mhz (3rd harmonic) and
transmit on 146mhz somewhere nearby.

Instead of using C89 pad you can go from the coil to the ground pad on the board edge and use 0805 parts which are a little easier to work with. See http://wa5znu.org/2011/06/uvr3-lpf

Date: 2011-11-15 23:27:55 UTC
From: jerry
Topic: 262 Message: 3240

Thanks Bert. That is what I was looking for.
I assume I need to add the 33pf cap also. It appears to be the same size. I will also add the 100pf while I have it open. It appears to be a sizer larger.

Q. Do you know the number for 100pf cap size?

I tried the http://wa5znu.org/2011/06/uvr3-lpf link but it appears to be bad. Something about a bigger cap physical size for the 33pf.

Q. Is there anything else I should address while I have it open?

I have not worked with SMD before but have done a lot of pc board building over the last 40 years and have some .55mm solder that seems to work better on small parts.

I Have six of these that I plan to build a split site repeater for temporary use on events.

It's a bit confusing, but the first harmonic of 146MHz is 146MHz. In other words the fundamental frequency is the first harmonic.

ok, so the second harmonic, should be at around 292MHZ then?
Given the tx frequency of 146MHZ?
Again, right smack dab in the middle of no mans land as far as services...well, not precisely, since the Canadian military has a big chunk between 230 and 300MHZ, but it's all AM comms.
So unless you live on an air bass where they use 290 to 294MHZ, it's still not going to cause anyone any interference.
I'm speaking from a purely Canadian perspective here...I think there is some satellite alocations near those frequencies in the EU.

It's a bit confusing, but the first harmonic of 146MHz is 146MHz. In other words the fundamental frequency is the first harmonic.

hi,

a testserie driven with a few brand new uv-3r, bought by different OM, at the ham fair in friedrichshafen\germany this year, brought the tester to the words: "you can order a jet fighter with it!" - that's what is to read in reports and magazines about it over here.

I will explain how I have made the measurements and the screen dumps as shown in the PHOTOS section of this group: I have used the Delta marker function of the spectrum analyzer to get the signal level relative to the frequency set on the UV-3R.
The Delta marker also shows the RELATIVE frequency, so that's why the marker has the same frequency as the (fundamental) frequency.
So just double this value and you will get the frequency of the 2nd harmonic.

Hi Tom,

I'm looking through your graphs in the photos area. Maybe I missed the relevant post but could you just explain what the different views are, or put a link to that description?

Thanks,

Richard

I think you're missing the point a bit, at least here's my perspective. I'm not sure about the particular issues in this case, I'm just thinking generally.

As hams we're allocated some of the spectrum to use. Its our individual responsibility to make sure we don't use the bits that we haven't been allocated. Also it's not really up to us to decide that some band we're transmitting over isn't important and just carry on doing it anyway. That will very likely have been allocated to some purpose and whoever has the right to use it has the right to do so without our interference.

Many sectors are vying for extended frequency use in most countries. The radio spectrum is important for many reasons, not least commercially. Example: if someone wants to make a case for reallocating 433Mhz to mobile phone use and they can point to the fact that it is "only" being used by hams and that these hams are also irresponsible and causing interference outside of their band as a result then that's just another nail in the coffin.

I realise in some countries this might seem to matter less, but I think the amateur allocations are reasonably generous in most places, so why don't we just try to stick to them and make sure that manufactured equipment does the same?

A very good point indeed. as a matter of fact, we are a self policing fraternity, which rarely needs the entrance of the FCC because we do hold ourselves to a standard.

If anyone cares, the radio is FCC certified, under part 90 of the Rules and Regulations, Industrial/Business, which in this country is 150-174 MHz. If you do not believe me, check under the battery for the FCC compliance label. You can research the FCC ID, ZP5BF-3R, on the FCC website in detail.

I have contacted my vendor, but received no response as of yet.

3248. 2nd harmonic on Mark II

Yahoo group: UV-3R (2011)
Date: 2011-11-16 15:37:21 UTC
From: sieger82
Topic: 3248 Message: 3248

Hi,

I've been reading the discussion about the second harmonic suppression with a lot of interest.

Can anybody confirm that the LP filter for the Mark II (with dual display) is the same as the first generation uv-3r? Because on this website: http://herwig.shamrock.de/uv3r-en.htm it is mentioned that as of September 2011 the second harmonic problem has been solved. So I'm wondering, does the Mark II have the same problem or not?

>
> Q. Do you know the number for 100pf cap size?

This should be a 0805 or 1206 sized type, the distance between the pins
allows either size here.

> I tried the http://wa5znu.org/2011/06/uvr3-lpf link but it appears to be bad. Something about a bigger cap physical size for the 33pf.

Yes, 33pF is just a compromise between harmonics reduction and VHF
bandwidth. If you are sure never to transmit above 150Mhz, you can
safely increase the C up to 47pF to have a better harmonics reduction.

> Q. Is there anything else I should address while I have it open?

For my devices I've corrected various things like the amplification of
the AF PA, the direct injection of the tone call signal, a better mic
amplification and so on. But I didn't document these yet.

> I have not worked with SMD before but have done a lot of pc board building over the last 40 years and have some .55mm solder that seems to work better on small parts.

An important tool for soldering 0402 parts is a 10x magnification glass
to inspect the quality of the solder points and to check if there is no
unwanted tin bridge to other parts in the neighborhood.

Greetings:

I purchased a UV-3R from an ebay seller. Radio was used, DOA, and had been programmed by prior owner. Radio was not even reset prior to my receipt! Seller claimed to be located in North America selling"100% brand new" radios.

Please, save yourself some major, major frustrations by purchasing from an honest, American retailer that provides a warranty and an address in the USA to ship your radio to, in the event of issues. Spend more to get more.

Thanks to you all for the great information on this little jewel. With a little luck my next one will work.

Sorry to hear of your problems. As an active ebay buyer and seller I'd observe that you do have recourse with ebay for the "misrepresentation" of your auction purchase. Secondly as many on this group site may be future buyers of the rig via ebay it may serve the group to know your sellers id as a caution. I also assume you left negative feedback re the transaction?

If the radio was DOA, then how'd you know there's stuff in the memory? Just wondering because that seems to be a contradiction. If I read DOA, I assume dead on arrival means it doesn't even power up.

Thanks again Bert. I have ordered the parts. Looking forward to seeing your other mods. And I did work with a SMD device in 1970, I had forgot about that. Had to wet the pad. Set the device on the pad and reheat the pad. All contacts were under the device. Took readings on the board to see if all pins were making contact. - Jerry

Not that this means that the radio you received wasn't previously used, but these radios do come with frequencies programmed from the factory. Both of mine were factory fresh and both had frequencies programmed.

It would be nice to get a little more info.

How did you determine it had been used? Was it obviously worn and scratched? If it was due to having been previously programmed, well as has been mentioned that's how they come.

If truely DOA you would not be able to tell if it had been programmed.
Also if DOA, perhaps it has a bad connection at battery terminals or a defective battery. Have you tried contacting the vendor to see how he wants to handle your concerns? Don't suffer in silence, if you have an issue contact him, I'm sure they will accomodate your concerns.

If not, you do have the option of filing a dispute with Ebay if the item is not as described.

I have purchased a couple of these off of Ebay and about eight from 409Shop, and have not had one issue that wasn't handled promptly.

Regards,
Jake

Jake:

There were scratches in the lcd area, 25 + frequencies were in memories.
Radio would not transmit in vhf or uhf.Plus seller advertised that radio was in North America when in fact it came from PRC.Perhaps DOA was a little to dramatic, sorry.

Ebay is getting me a full refund then i will purchase one for $8.10 more than what I paid for original. One year warranty, shipped to US location if problem. That's cheap piece of mind.

Regards,
John

E bay is handling a claim for a full refund

Bob,
From these comments, there are some things I can clarify.

--- "gm4cid" <robert-mcclements@...> wrote:
>...Post modification the radio is legal for amateur use but FCC approval is no longer valid

While in general, this would be true, The radios with the high level of harmonic (measured by some here and by ARRL's Bob Allison) far exceed (by more than 42 dB or 16,000 times in power) the certification data that was submitted to the FCC and clearly have some kind of production control problem (intentional or accidental).
They are not "valid" out of the box.

I have provided some information that I hope will result in getting the manufacturer to get this corrected. I do not know when this may occur, nor if shipped radios could be recalled, but (At least some) radios out in the hands of customers exceed the original FCC limit by at 15 dB or more. This is not, in my opinion, normal manufacturing variation. I have been involved professionally in FCC "Type Acceptance", now simply called "Certification", for many years.
That said, this radio is certified under U.S. Part 90. This is land mobile such as police, fire, garbage truck, etc. The radios measured with this high harmonic are in violation of that certification. Following that issue is one thing.

> QST statement is correct when the UV-3R is used mobile or fixed with a regular externally connected antenna.

I'm not sure what QST statement to which this refers. The original certification data sent to the FCC shows a second harmonic Conducted out of the antenna connector into a 50 ohm load to be some 42 or more dB below (better than) that being measured on these radios. This is at least 15 dB above the FCC limit they are supposed to be meeting.
Spurious that are conducted out the antenna connector are part of the FCC limits and data must be provided for Part 90 Certification.
There are *also* limits on the spurious radiated from the rubber antenna and data was submitted to the FCC.

> But should the text have stated that this handheld radio can not be used as-is with the supplied rebber duck antenna?

I don't follow the intent of this comment.

> Is it practical to connect the rubber-duck via a low pass filter and use the radio in handheld mode?

If you have one, it is certainly possible and would help a ham meet his obligation to meet the FCC requirements.

> My initial thoughts were that perhaps attennuation of the second harmonic by the rubber duck antenna would give mitigating results but measurements by Joe K1IKE rule this out.

While this can be possible (rubber antenna reducing the harmonic) it stands that the Conducted Emissions are above still the limit that they are supposed to have met.
I suppose one could use the antenna as a "harmonic filter" *if* it was un-removable and there was no connector to measure any Conducted spurious.

> Question - should handheld radios require additionally FCC spectral testing with their supplied rubber duck antenna connected?

This would not be additional. For those services where hand held radios are required to get FCC Certification, This *is* done. This comes under the category of "Radiated Spurious". Data was supplied in the FCC certification data package for this also on the UV-3R. If anyone wants this document is ia available on the web or email me and I can send it. The folks at the ARRL Labs didn't realize that this radio 'had' passed Conducted limits (In the FCC filing) until I pointed it out.

IN GENERAL, FCC certification requires many measurements to be made and the results submitted for approval. Obviously, all data must meet the FCC requirements. This requires such measurements as transmitter power, modulation characteristics, conducted and radiated spurious (harmonics and any other possible signals). "Conducted Emissions" are from the antenna connector and "Radiated Emissions" being from the "box". In addition, many detailed Receiver characteristics are also measured.

All that said ... Manufactured Amateur radios DO NOT require this kind of Certification for the FCC. Things like transmitter power and harmonics are not measured, submitted and approved. In fact, almost nothing is measured/approved. Amateur radios (except power amplifiers) are not certified; except for two things. One is not being able to receive the analog cellular frequencies either directly or via a receiver image (to a point), and not radiating (from the box) above Part 15 limits when receiving. Many hams think they are rigorously tested for many parameters, but they are not.
These radios are not meeting the original FCC Part 90 certification and are in violation. Hams can use them and are obligated to get the harmonic below the Part 97 limit, which (and I don't know why) happens to be 3 dB lower (-16 dBm) than the Part 90 limit (-13 dBm).

Hams fall under Part 97 and for the most part are on their own to meet FCC requirements; even with commercial radios.

Good news that you are at least being looked after John.

It does sound as though you were shipped a radio that was probably returned! Unfortunately there are some unscrupulous dealers in every walk of life.
Did the dealer not volunteer to exchange the radio?
Or did Ebay have to step in on your behalf?

I did have one unit whose main function/tunning dial worked erratically. After spending $10 Cnd. to ship it insured back to HK, it was soon replaced with an entirely new radio. Of course this does raise the price 25% LOL, but at these prices, no biggie.
Nothing like dealing with the guy with a brick and mortar radio shop on the cornner, but for many of us that option is not always avaiable.

Regards,
Jake

3263. Re: [UV-3R] 2nd harmonic on Mark II

I have done some rough testing antenna to antenna on my mkii to a hp853a/hp8559b spec an and the results are disappointing. Set to 145.19 down 600 the second harmonic is only about 6 dB down. I confirmed the spec an is in the linear range by increasing attenuation and both signals dropped in concert with the attenuation change. On 146.49 simplex the second harmonic is down 23 dB. On 440 I was unable to find a frequency where the 2nd harmonic is down less than 45 dB or so.

> perhaps I don't understand harmonics as well as I should, but isn't the second harmonic for the 2M ham band, assuming a tx frequency of 146MHZ, around 584MHZ? ...

Colin,

For a long time I've often wondered if anyone was confused by this and you are the very first person I ran across.

The "Harmonic Number" is the multiplier used to get the frequency, not the "Nth" thing above it.

The second harmonic is two times the fundamental, etc.... We never actually talk about the "First Harmonic". We always call it the "Fundamental".
Yes, the *first* "thing" which is a multiple that is 'above' the fundamental is twice the frequency. However, it is still called the Second Harmonic, even though it truly is the first thing up there. This is one of those things that just is.

Like ROM is also Random Access Memory. RAM is also RWM (Read Write Menory) Terminology starts out by whatever means and just gets accepted and carries on.

Is a little like the fact that the Earth's "North Magnetic Pole" is actually a South Magnetic Pole! True ... think about it.

> Absolutely nothing to interfere with around here on 580/600MHZ.
> And even if there was, it would be digital or data streams where FM carrier wouldn't effect it anyway. ...

Well...
A - From a purely "Practical" view. If you never interfere with something else, you won't get into trouble even if you have terrible harmonics, right? ... So why have limits at all?

B - AN FM carrier not only can, it *will* interfere with a digital signal. In Japan several years ago, "Citizens Band" Radios started appearing on frequencies right in the middle of the CDMA band and killing the base site's receivers. A strong signal of any type will cover and disrupt any other kind of signal if strong enough - that is, if it is about the same strength as the desired signal - regardless of modulation type.

> I wonder if the experts on the list could give an estimate of a real world senario? If I was transmitting on the UV3R on VHF with 2W or so, how far away could a typical real world receiver hear the second harmonic?

Strange you should ask...

This is the "Practical" Aspect I mention above. If nobody is listening, are you transmitting a spur? A spur of the magnitude that these radios emit can *easily* be heard miles away.

I just realized something that helps answer this question. I am 3 miles from one local 2 meter repeater. I have been measuring the repeater sensitivity for many years by putting a calibrated level into a 1/4 wave antenna in my attic (at 15'). I only want a relative measurement to watch the repeater over the years, but it helped identify a high power line noise level several years ago.
Coincidentally, it typically takes only -16 dBm to bring it up. This is right around the FCC limit (actually right on it) for Part 97. The UV-3R's second harmonic is at least 17 dB higher. This 17 dB is 50 times higher power. That translates to about 21 miles. Yes, this just brings up the repeater, but within that 21 miles it is stronger and that is lots of territory and lots of other things.
BTW, It doesn't take much less with a small antenna at gound level.

> I know, that isn't the point, but I'm just curious as to what real effect this problem has in the real everyday world. You can bandy graphs and charts around allot, and test in controlled conditions, but how does this effect the average user of the UV3R?

Those of us used to looking at graphs and theories understand the real world impact. I know you are just asking, but the correct answer to this is the following.
If everyone thought this way we'd have all kinds of interference. By placing the kind of limits that we do, we significantly reduce the 'Possibility' of interference. Notice that we do not reduce it to zero.
EVEN at the required limit you can interfere, but it is not too likely. Read the manual for any kind of equipment with Part 15 certification. It says that if you get interference you must accept it and if you cause it you must stop using it. It does not say that it can not cause interference -- EVEN THOUGH IT MEETS FCC Part 15 LIMITS.

> Considering no one would transmit without an antenna on the radio anyway, the problem seems to be a moot point.

That is not what the information we have says. If you take the ARRL Labs number of 6 dB (antenna attenuation of the harmonic) , the antenna harmonic signal is still 11 dB high or 13 times the power of the FCC limit.

> I guess if your a stickler for FCC regulations and follow those to the letter, it's an issue...or regulations of whatever governing agency in your own country. But, I'm sure any of us who drive have exceeded the speed limit while driving and not thought twice about it if the conditions and situation were not going to harm anyone.

That is a poor analogy. A better analogy would be speeding vs. running 1,800 watts. Few will notice.

Spurious signals are more like driving with a 10 foot long beam sticking out the side of the car. As long as you drive on desert roads, you can relax because you "probably" won't whack any hitchhikers in the back of the head.

There *is* a real world reason for having limits of this kind and some astute folks, long ago, realized this and put things in place, like Part 15 and the other Certifications. Now, we are seeing how good, or not, these limits are... and how easy it is for even those chartered with protecting the spectrum (a.k.a. FCC) too often "don't get it". - like BPL, LightSquared and to a lesser extent AM HD broadcast.

OR closer to *your* real world... What's your S-Meter read on an empty 80 or 40 meter frequency these days? Is it always as S zero? Do you hear any strange buzzes or whistles?

Mine is up around S7-9 pretty much all the time ... Have you listened to 433.9 lately?
AND this is WITH Part 15 certification on all the stuff in the neighborhood.

Hope this helps put things in perspective.

3271. Re: UV-3R - December QST Technical Correspondence

Yahoo group: UV-3R (2011)
Date: 2011-11-17 13:29:34 UTC
From: gm4cid
Topic: 3205 Message: 3271

Steve,

I thoroughly agree with all your comments both on this thread and on the related second thread. I too have type approval experience albeit on this side of the pond.

In simple terms QST second harmonic measurements show a fail by at least 15dB (order of value verified independently by members on this forum) and this, from your statement, exhibits a 42dB deviation from data submitted to the FCC.

Your comment that there is clearly some kind of production control problem (intentional or accidental) is more than valid.

Vero must be aware of the situation and also how trivial in disruption to production and cost it would be to correct this issue plus the rx audio level and tx lockup with supplied mic/earpiece.

The question surely is why do Vero not take corrective action ?
As part of their QA procedures they should periodically take random samples from production for comprehensive testing and apply necessary corrective feedback to their processes.
In addition customer feedback should also be taken into account.

> This would not be additional. For those services where hand held radios are required to get FCC Certification, This *is* done. This comes under the category of "Radiated Spurious". Data was supplied in the FCC certification data package for this also on the UV-3R. If anyone wants this document is ia available on the web or email me and I can send it. The folks at the ARRL Labs didn't realize that this radio 'had' passed Conducted limits (In the FCC filing) until I pointed it out.
>
> IN GENERAL, FCC certification requires many measurements to be made and the results submitted for approval. Obviously, all data must meet the FCC requirements. This requires such measurements as transmitter power, modulation characteristics, conducted and radiated

spurious (harmonics and any other possible signals). "Conducted Emissions" are from the antenna connector and "Radiated Emissions" being from the "box". In addition, many detailed Receiver characteristics are also measured.
>
> All that said ... Manufactured Amateur radios DO NOT require this kind of Certification for the FCC. Things like transmitter power and harmonics are not measured, submitted and approved. In fact, almost nothing is measured/approved. Amateur radios (except power amplifiers) are not certified; except for two things. One is not being able to receive the analog cellular frequencies either directly or via a receiver image (to a point), and not radiating (from the box) above Part 15 limits when receiving. Many hams think they are rigorously tested for many parameters, but they are not.
> These radios are not meeting the original FCC Part 90 certification and are in violation. Hams can use them and are obligated to get the harmonic below the Part 97 limit, which (and I don't know why) happens to be 3 dB lower (-16 dBm) than the Part 90 limit (-13 dBm).
>
> Hams fall under Part 97 and for the most part are on their own to meet FCC requirements; even with commercial radios.

From: DavidN
Topic: 3205 Message: 3272

Perhaps we're missing a point here, and I'd be interested in those who have the necessary equipment to perhaps follow my thoughts and make some further measurements.

This subject has, of course (as always!), been discussed before on this forum - about eight to ten weeks ago I think. One valid point made then was that this rig was not specifically designed for the ham bands, but it was stated that more likely it had been deliberately designed by Vero for using round building sites, factories, etc etc., by the workforce. From what the grey cells can remember measurements made then found that the component values used for the frequencies used in this type of application (160MHz I think) showed the second harmonic to be a lot less.

It's just that the UV-3R is at present being promoted as a ham rig, when the original designers perhaps didn't design it that way... it's just that the 1846 chip included the ham bands!

So, is there some mileage in measuring the second harmonic of frequencies used for such situations to see if there is an improvement?

Regards, .d. G4TUP.

My radio has an FCC ID. It is located beneath the battery, the ID is ZP5BF-3R. The label further states it is certified under part 90.

It would seem this radio has more problems than just the harmonic issue. My vendor is so far non-responsive to all of my inquiries.

The Mk2's that I have purchased all have the same harmonic problem.

I have purchased about 5 in recent times, the last being 2 weeks ago.

Jake:

I too, felt I was shipped a returned radio. These e bay radio sellers are interesting, to say the least. Also felt there was a problem when it only took 20 minutes to get a full charge
on the battery and other forum members said theirs took 5 hours to charge....

The good news is that's the only time I ever got the shaft on an ebay transaction.

Regards,
John

Sounds good John.

In all fairness though you will get the odd dud when they are produced in the quantities these are being produced in,(look at cars for instance LOL), but the scratches tell me it's been around more than anything.
Someone correct me if I'm wrong but I beleive they come with 20 frequencies already programmed into it, at least all 10 I have ordered for myself and associates have been. So don't be surprised when your new radio comes this way as well.

Also although my radios do require close to 5 hours to charge through the radio's DC port, all of the radios I have received were almost fully charged as delivered.

Regards,
Jake

>when your new radio comes this way as well.

All UV-3R's come preprogrammed with a series of frequencies
in the memories--most of which don't make sense for HAMs.
This has been the case for me for 2x Beofeng UV-3R, an MTC
UV-3R, and a Beofeng Mark II. It means nothing, as this is
apparently the factory default.

>Also although my radios do require close to 5 hours to charge
>through the radio's DC port, all of the radios I have received
>were almost fully charged as delivered.

All my UV-3R's also appeared to be mostly charged and were
usable before charging. I believe the battery is fully charged at
the factory, but the manual says you should charge them, simply
because there is no way to tell how long the radio will take to
get to the end user, so the charge may have been depleted.

Scratches, however, are another issue. But if they aren't bad
and the radio worked fine, I wouldn't have worried about it.

Good luck with the new radio!

Darvell (N7LN)

This is a great option...you get total versatility...portable/mobile/home charging with the same cable....If you have a USB battery pack you can run it on AA bats or any USB power source....
I wonder why they went with Negative tip instead of the more common positive tip? I could have used this with my Bluetooth headphones if it was positive tipped.

3290. Re: Serious harmonics problem on VHF! P.S.

Yahoo group: UV-3R (2011)
Date: 2011-11-17 22:14:00 UTC
From: jerry
Topic: 262 Message: 3290

I now have the 0402 caps 2-3.3pf and 1-33pf to correct the 2nd harmonic problem and have removed the circuit board.
I think I can put the 3.3pf cap. in on the side of the board but not sure about the other two. The point on my 50 watt Ungar iron with a PL111 tip is the same size as the end of the chip. I put a brand new tip on so I would have the smallest tip possible. But I do not think I can solder the coil ends without the iron touching the coils. The solder I am using is also the same size as the end of the chip. I am thinking about putting the board in a jig and using an attached safety pin to hold the chip in place while I solder.

Any hints on soldering the ends next to the coils?
Q. What equipement has been used by others?
Any tips would be appreachated.

This my first at working on something this small. - Jerry

I agree with you David. Some years back, when the Quansheng handhelds first became available, the then Australian importer, the late VK6NX and I attempted to get the factory, with which we had very good contact, to consider changes to better suit their single band radios to the wider market, particularly through the addition of features such as smart chargers, alpha-tagging of memory channels and DTMF.

On each occasion, the response was very friendly and appreciative of our interest in improving the product but their main focus was on the domestic Choinese market, where they were then selling 30,000 radios each month. Over time, some of those suggestions have been incorporated although I note that the latest TG-UV2 still does not offer DTMF.

There are some signs of improvement in the overall package though. My latest UV-3R arrived yesterday from 409shop and for the first time, a Mk2 actually has a Mk2 operator's manual!

Colin,

I am pleased MSG 3264 helped. I spent quite some time editing and making sure it was clear and correct and hope it reduces the speculation and adds to understanding of the Certification process.

3297. RE: [UV-3R] 2nd harmonic on Mark II

Yahoo group: UV-3R (2011)
Date: 2011-11-18 02:04:32 UTC
From: Al Waschka
Topic: 3248 Message: 3297

I have done some more testing and an interesting artifact popped up. The problem is worse on low power than on high. And it is worse the lower one goes in frequency. At 145.67 MHz low power the second harmonic is only down about 6-8 dB and on high it is down over 25.

While changing the filter seems to help, there may also be a problem with the way low power is implemented, i.e. a bias problem in the final amplifier.

Al K5TAN

From: UV-3R@yahoogroups.com [mailto:UV-3R@yahoogroups.com] On Behalf Of Al Waschka
Sent: Wednesday, November 16, 2011 9:58 PM
To: UV-3R@yahoogroups.com
Subject: Re: [UV-3R] 2nd harmonic on Mark II

I have done some rough testing antenna to antenna on my mkii to a hp853a/hp8559b spec an and the results are disappointing. Set to 145.19 down 600 the second harmonic is only about 6 dB down. I confirmed the spec an is in the linear range by increasing attenuation and both signals dropped in concert with the attenuation change. On 146.49 simplex the second harmonic is down 23 dB. On 440 I was unable to find a frequency where the 2nd harmonic is down less than 45 dB or so.

I apologize in advance if I have missed any postings. However, has anyone tested the UV-3R to see whether it displays the same problem of excessive harmonic radiation when programmed to transmit in the commercial VHF band?

As I have a commercial VHF license, I plan to look at my radio on a spectrum analyzer when I get time to do so. If someone has already done this, I'd appreciate knowing.

Thanks.

Hello all,

we got here quite a lot UV3-R s - I have sold them all to friends in our club and some on ebay but we did all modify them here before selling. This was quite a lot of work and we did measure every unit with the spectrum analyzer. Even after modification you should not use it on "low power" position.
Outside the 2m hamband at 160MHz the UV3R has a good harmonic supression and also 70cm should be no problem.

All facts about these units were known months ago. I did put a notice here in the group and but nobody did care about it.

After we measured a UV3R-MK II I did stop selling those units because there was no improvement and the mods were too much work. And all our friend have already one :-).
There was a review in the german magazine "Funkamateur" and the author did als mention the bad harmonic suppression. After that one of the german importers (DIFONA) stated that there units had a CE Mark and are all within the specifications. I could not check this because I did not want to buy a unit from him.
I wonder if someone has measured one of these units. There is another german company advertising of doing the mods.

There other very nice 2m handhelds(5W) from China with excellent harmonic supression and good specs but with no FCC/ CE mark. I did measure here a HLT-V8 . It has excellent specs and very well built.

Reply from Vero Telecom

Dear Bob,

Actually,our factory and Baofeng are the different company.We are the VERO factory,so we can make sure that all our radios are the update models in the current market.(Our serial no. is 1163778303500XXXX).

But for Baofeng's,we really do not know how to identify it,so please kindly understand us!

Any other questions,please do not hesitate to let us know!

Thanks and best regards!

So now interestingly we need to ask Baofeng, wonder if they use a different serial numbering system..

From: Jaap De Goede
Topic: 1819 Message: 3302

My Baofeng UV-3R mark II has a bug I did not find in the FAQ:

Bug:
-Trying to change the step size from the menu in UHF mode does not work.
Workaround:
-The tuning step size can only be set from the menu when in VHF mode.
-The step size set in VHF mode is valid for both VHF and UHF.

Cheers, Jaap

When a manufacturer gets an FCC certificate is it valid for the OEM as well? I mean apparently Vero Telecom has a certificate for a UV-X4, which is not a UV-3R mark ii, is it? I'm with a company that sells through OEM as well, but intentionally sticks to the original type numbering of the radio equipment to avoid redoing the homologation process.

Ok David, as you can read I'm not native English :)

Anyway I found FCC information on the *Baofeng UV-3R*, which is not
the *Baofeng
UV-100, Baofeng UV-200, Baofeng UV-3R mk II, Vero UV-X4, etc.* I'm really
curious what product is FCC approved now.

https://fjallfoss.fcc.gov/oetcf/eas/reports/ViewExhibitReport.cfm?mode=Exhibits&RequestTim
eout=500&calledFromFrame=N&application_id=186528&fcc_id=%27ZP5BF-3R%27

Cheers, Jaap.

3310. UHF Step-setting bug not in the FAQ (was Re: [UV-3R] FAQ)

Yahoo group: UV-3R (2011)
Date: 2011-11-18 16:34:35 UTC
From: N7LN (Darvell)
Topic: 1819 Message: 3310

Yup, I noticed this 3 or 4 weeks ago and posted here. I guess it didn't get into the FAQ. It's very annoying and quite a disappointment, because the original non-Mark-II UV-3R did not have this problem. It's a new bug that popped up with the introduction of the Mark II.

Subject: [UV-3R] FAQ

My Baofeng UV-3R mark II has a bug I did not find in the FAQ:

Bug:
-Trying to change the step size from the menu in UHF mode does not work.
Workaround:
-The tuning step size can only be set from the menu when in VHF mode.
-The step size set in VHF mode is valid for both VHF and UHF.

Cheers, Jaap

From: Jaap De Goede
Topic: 3313 Message: 3313

You have to unsolder antenna middle pin from PCB to be able to remove PCB.

See: http://www.brickolore.com/2011/06/baofeng-uv-3r-disassembly-2.html

hello.

I just discovered a strange behavior.
When charging the battery, if you push PTT while the battery indicator is on zero, the HT won't transmit.

It's seems that they disabled emmiting while indicator is showing empty a battery.

The problem is that this indicator is cycling zero to full while charging...

I don't think the Mark II will transmit at all if the charger is plugged in, battery at zero or not.

I'm guessing there are issues in transmitting while external power is applied.

If you push PTT just a second later, it will work.
It's difficult to explain, just try it.
It's not a problem if you carry the HT outside but if you use it like a repeater, you can face a miss fire.

3318. UV-3R for use with 150Mhz business license?

Yahoo group: UV-3R (2011)
Date: 2011-11-18 23:25:23 UTC
From: N7LN (Darvell)
Topic: 3315 Message: 3318

I showed my UV-3R Mark II to a friend of mine, who has a business license for around 152Mhz. I tuned my radio to his frequency and showed him that it can transmit there.

Apparently, the business band there is moving to narrow bands in about a year, and I think the narrow band setting on the UV-3R is correct for the new regulations.

Question is, is my UV-3R legal for use on this frequency? He already has a few radios on this frequency and valid license to use them. Would it be legal to add a UV-3R to his "fleet" of radios? Are there requirements that the frequency be channelized and programmed and not enterable from the front panel? I was thinking that might be the one "gotcha" he might have. (In that case, maybe the programmable Wouxen's would work.)

3319. Re: [UV-3R] Re: Little bug with MK2

Oh, I see what you're saying. If the meter is on empty during the charging animation, the PTT won't work. Is that right?

I tried transmitting with the power plugged in and found the same thing, and the battery was not low, so I just assumed it didn't transmit with the power applied. Good catch.

I only use mine for 70CM so its not in violation of any regulatios as far as I know. The other Question is the second harmonic issue at one frequency or across the entire band. Some one out there must have a service monitor to verify the statement. A second harmonic trap should be easy to fabricate and not beyond the means of quite a few armatures.

If you pull the Test Report you will see it is for the Model Baofeng UV-3R only. The others should have their own FCC filing. It a manufacturer has several models that are the same internally, then I think the Filing should call them all out.

What gets me is that Vero and Baofeng both appear to make a UV-3R, in different factories. So, there should be an FCC filing for the Vero model also under the Vero name, I would think.
What a mess.

... and to top it all off, my main computer display died.

Joe,

Correct.

> The other Question is the second harmonic issue
> at one frequency or across the entire band.

It is high at the low end of the band (132 MHz) and getts better as you move up until it is in spec higher up (around 160 towards 174 MHz.). In the 2 meter band it is out of spec. This is aparently because the harmonic filter does not roll off at a low enough freq

> Some one out there must have a service monitor
> to verify the statement. A second harmonic trap
> should be easy to fabricate and not beyond the
> means of quite a few armatures.
> Joe WA2DZO

Adding the single 33 pf cap that several people have done, and explained in the Files Area, is a much easier fix for the 2 meter band.

Hi! Are you using a 4-pin plug? And is it pushed fully home, as some need that extra push for it to be fully in. Note also that the wiring to the plug is different to, say, a Yaesu one.

Hope this helps,

.d. G4TUP.

Topic: 3205 Message: 3326

I finally did some checks with my UV-3R on my HP8920 test set.
Frequency is in MHz, Hi and Low Pwr readiungs are the relative levels of the
2nd harmonic at the two power settings.

Frequency	Hi Pwr	Low Pwr
136	-21	+4.8
137	-21	+5
138	-21	+3.5
139	-21	+3.4
140	-21.6	+2.5
141	-21	+1.5
142	-20.4	+0.8
143	-20.3	-1.2
144	-20.9	-3.3
145	-23.1	-6.8
146	-27	-9.6
147	-27.5	-13.8
148	-32.7	-14.1
149	-33.3	-23
150	-36.2	-24.9
155	-48.7	-43.1
160	-49.8	-53.2
170	-49.7	-50.4
173	-48	-50
400	-37.8	-33.8
410	-48	-40
420	-58	-46
430	-62	-53
440	-56	-55
450	-56	-55
460	-55	-55
469	-55	-55

Interesting figures on low power at the low end of the VHF range where the
2nd harmonic is stronger than the fundamental!
My UV-3R was bought very soon after the radio first appeared on the market.

Grant, ZL2BK

It would help if you specify Mk1 or 2, since they work in a totally
different manner.

However the clue may be that you said programming by software makes
a difference and at this point I'm going to guess it's a Mark 2.

The software has an option for telling the Baofeng what priority
channel it should use.

Now the Baofeng actually has Dual Watch, AND priority watch.

You should only have one of these switch on at any one time,

This should get you started ;-)

- Andy -

If you have a tinker with them you'll see what I mean and

Hi Grant. Were these measurements made direct out of the ant. socket or with an antenna plugged in?

One thing that has occurred to me is that rubber duck ant. have a coil and a capacitor in them. Does this mean then that the capacitor would reduce the 2nd harmonic and so the 33pf mod is not needed?

Hi Steve, sorry to hear about your computer display, so I just wonder if you can read this :)

Anyway, just to save any confusion down the line, the UV-3R Mk.I and II, the UV-100, 200 and -X4 are all made by Vero. They have no badge on them and then companies like Baofeng, MTC, Magiksun, Comtex and Zastone, badge them and sell them. So you could have a UV-3R that is badged Baofeng but a Comtex (sold in Germany) is exactly the same, save for the badge. So, none of these companies make them, only Vero.

So if you wish to start selling the UV-3R and/or its derivatives, you could go directly to Vero to buy in bulk from them, and put your own badge on.....

http://www.vgc.hk/index.htm

(note that the VR6600 on the home page above is due out early 2012).

.d. G4TUP.

Too bad about the monitor. If it's an LCD type, pull it apart and check the electrolytics. Most manufacturers use common parts all made to the lowest prices and many cheap electrolytics in the switch mode power supplies dry out and leak. They are easy to see as they will have swollen tops where the pressure seal has fractured. There's a lot of information on the internet on repairing LCD monitors with this problem Doesn't matter if it's a cheap or expensive brand, the problem is often the same as they use the same parts.

Grant, ZL2BK.

I have this same problem. I have downloaded latest software, made sure same comm port as before was selected, made sure programming lead was pushed all the into the socket. Used 3 different compueters with negative results. However, I did manage to program 2 other UV-3Rs without any problems what so ever. Any suggestions please anyone.

Yes, this is true. I went ahead ans ordered a USB cable from Hawaii radio. Hopefully that will solve the problem

From: andyfoad@rocketmail.com
Topic: 3332 Message: 3332

About an hour ago I decided to do a little practical test.

How far can I hear a Baofeng harmonic on 290Mhz ?

Rig 1 = UV3R No LPF mod using Nagoya 701 rubber duck
Rig 2 = UV3R 33pf LPF mod using Nagoya 701 rubber duck
Rig 3 = Yaesu VX7R on 2.5w setting using Nagoya 701 rubber duck

I sat them all up in my roof space and left them transmitting
on slightly different frequencies so that I could check each one
easily at the same time. (25Khz apart, nominal 145.000).

Each HT was physically seperated by about 12 inches.

I then took a quick walk down the street listening to the
harmonics. The receiver used was my Alinco G7 with
a Nagoya 701 rubber duck.

Rig 1 = harmonic faded into noise at about 200 yards away
Rig 2 = harmonic faded into noise at about 150 yards away
Rig 3 = harmonic faded into noise at about 220 yards away

Erm, so the VX7 harmonic could be heard *stronger* than the
unmodified UV3R, and the best suppression was the modded UV3R.

Holy crap - I didn't expect that one!

Yes - you stand more chance of OFCOM or the FCC knocking on your
door if you use a VX7.

Those are the real world facts and I'm not sure what to say ;-)

Well,

You can say that you inspired me to do the same test with some of my gear. I don't have these analyzers.... I was thinking about doing this mod on the UV-3R mk II. Now I will first compare my Wouxun KG-UVDP1, Baofeng UV-3R mk II and Ronson RT-26v.

Cheers, Jaap

The measurements were done with a direct coax connection from the UV-3R to the HP8920 RF in / out in connection. My 8920 has the 60 Watt input option. The spectrum analyser was set (on VHF measurements) to 200MHz span with the centre frequency changed slightly to allow for the frequency being measured.
It would be interesting to check the relative levels with the single band VHF antenna on the radio. The problem would be ensuring the test antenna on the analyser has the same response on the fundamental as well as the second harmonic.
I just checked for the higher order harmonics and they are almost non existent.

Subject: Re: [UV-3R] Re: UV-3R - December QST Technical Correspondence

Hi Grant. Were these measurements made direct out of the ant. socket or with an antenna plugged in?

One thing that has occurred to me is that rubber duck ant. have a coil and a capacitor in them. Does this mean then that the capacitor would reduce the 2nd harmonic and so the 33pf mod is not needed?

.d. G4TUP.

the only thing i can think of is that the vx7 was putting out slightly more power than the UV3R's were, perhaps half a watt, but maybe enough to make it heard further out...interesting though since the yaesu should have nothing getting out at those frequencies.
I wonder if all HT's weather amateur or commercial would show similar results at the second harmonic?

Just out of curiosity I did a FCC license search by frequency and in that portion of the Fixed,Mobile and Satellite Mobile segment, there appears to be just three active licenses.

WBS8 - Phoenix-Mesa Gateway Airport
WQOG795 - Exchange Club of Redding
WST7 - Chennault International Airpark Authority

Obviously this does not relieve one from the responsibility of meeting the requirement for 25W or less, in which case the second harmonic must be 40dB down from the fundamental.

My radio at 146.38 (the input of my local repeater) measured the second harmonic at -28dB relative the fundamental using a 40 dB coupler and service monitor at the antenna jack. Am I gonna open the radio up and do the mod? Maybe…….

3344. My second LPF mod; not quite as good

Yahoo group: UV-3R (2011)
Date: 2011-11-20 02:14:38 UTC
From: Leigh L. Klotz, Jr WA5ZNU
Topic: 3344 Message: 3344

I enhanced the LPF in a second UV-3R and the results were not as good as the first one.

This one started out worse: -14dBc at 144 MHz and -15 dBc at 148 MHz. (Oddly, this one had an FCC sticker in it, whereas the first one didn't.)

I first tried a 33pF and the moved to a 47pF capacitor (a 1206 size, mounted edge-on).

Using a 47pF cap and squishing the coil a little provided 20 to 25dB second harmonic suppression:

Results: -36dBc at 144 MHz and -40dBc at 148 MHz.

In absolute terms, that's 0.2-0.5mW, and it should be 0.1mW.

I've written up a report with pix of the modification and the HP 8559A spectrum analyzer screenshots.

Hi Jerry,

you really dont need to use 0402. Please use 0805 or even 1206. Here normally 0805 33p did do the job. Have a look on the pictures in this group and by other hams.
Suppression for the second harmonic is in the range from 42 to 48db (depending also on the caps specs-tried 2 manufacturers). Sufficient if you use this single band rubber stick which came with the UV-3R(good SWR on 145MHz).

It is really not a very difficult job. The assembly of the unit in my opinion is more difficult especially with these flimsy rubber buttons :-). We do it with a normal 50W Weller soldering station and a small soldering tip of course.

Leigh,

looking at your spectrum analyzer photo, your second UV-3R doesn't seem
to be quite as bad originally at 144MHz as you thought. The photo seems
to show it being -24dB, not -14dB.
Still only -15dB at 148 though :-(

Yes it's a Mk 2 and yes your solution worked.

One really annoying outcome of all this.
I was testing the new setup, could not open either of the local repeaters 2m and 70cm, when the UV-3R was hooked up to my colinear via an SMA-to-259 adapter. Using my Icom with 100 mw I could open the repeaters, WT!?

Was getting really frustrated with this, just didn't make any sense, I could listen and hear the transmissions on the input to the repeater freq's with no problems, it looked like the repeater wasn't getting the CTCST tone. Or so I thought!

Well after much faffing around, and now this is where everyone get's a good laugh. I was using 2 SMA-to-259 adapters, one on the Icom the other on the UV-3R, well you may have guessed it, the centre pin of the SMA had broken off, so no RF up the coax and therefore no opening of repeater.

ockham's razor.

Topic: 3248 Message: 3350

Hallo,

I bought 2 Baofeng UV3R MarkII. The second harmonic suppression without any modification was between 29db to 31 db. After Modification second harmonic suppression was not better, but the power on 144 MHz decrease from 1.8 Watt to 1.4 Watt !!!!!!!
Is there any other LPF in the Mark II. I add 33pf

In the old UV3R the modification work without any Problems.

Laurie,

Thanks for pointing out the mistake. I had mislabeled the screenshot
and swapped the 144 and 148 MHz images.
The -24dBc 2nd harmonic is of course 144 MHz, and the -14dBc one is 148 MHz.
I've fixed it.

Hi Laurie,
I've got a UV-3R MK2 now - We'll have to give it a test one evening and see how bad the second harmonic is. (good excuse for a beer)

3355. Mystery?

Yahoo group: UV-3R (2011)
Date: 2011-11-20 23:49:13 UTC
From: pstewart99
Topic: 3355 Message: 3355

After trying FM, my UV-3R automatically started returning to the FM band (on the lower display). The manual says to "press and hold L/R button to exit FM, but doing this turns on the siren without effecting the obsession with FM.
After trying numerous combination of buttons I finally gave up and reset the radio to the factory settings which solved the problem- but necessitating reloading my memories.
Does anyone have a clue how this came about, or more importantly how to shut of FM (without factory reset) should this happen again?

If you go to the FM broadcast band receiver any signal on the previous used ham band receiver frequency will make the rig switch to listening to that signal.

Is it that you were listening to an FM broadcast station, when a signal came up on a ham band, a repeater for example, the rig switched to that signal, and then you then listened for some time to that txm, and then at the end the rig switched back to the FM broadcast band?

This is what usually happens and confuses ops.

From: tuckmeat
Topic: 3358 Message: 3358

I recently purchased the Mk II version of this radio. The included headset speaker/mic that I got absolutely sucks. Not only is the TX audio quality horrible, but the VOX is useless with it because the mic isn't sensitive enough, regardless of the radio VOX level.,

Does anyone have any recommendations for some cheap earphone/mic or earphone/throat mics that work well with this radio? I'm especially looking for something that allows for effective use of VOX.

Thx

3359. Two typos in the PY2BBS schematics

Yahoo group: UV-3R (2011)
Date: 2011-11-21 08:13:49 UTC
From: Sivan
Topic: 3359 Message: 3359

Hi,

I noticed two issues in the schematics that PY2BBS uploaded to the files area.

One is the fact that the signal REG_SW, which I think is produced by the MCU to turn on the 3V regulator, is not produced anywhere (at least I could not find where). It is consumed by U9 and the base of Q17 (through a R16). Does anybody see where it comes from?

The second is the net of the base of Q1062 (also connected to B+, the collector of Q17, and a few other passives). The issue is that nothing in the schematics can supply current to turn on Q1062. Perhaps the part marked C31 in the schematics is a pullup resistor, not a capacitor (a capacitor there does not make too much sense to me). This is really not a particularly important issue, since it seems to pertain to control of VPP, the voltage that tells the MCU that it's being programmmed. Since none of us knows how to program the MCU, this is pretty much irrelevant to us, but it still seems like a typo in the schematics.

Regards (and many thanks to those who produced the schematics), Sivan

From: Edwin-
Topic: 3332 Message: 3366

This is quite strange, my UV-3r MK2 shows about 30DB for the 2nd harmonics, while my VX-7 shows 55dB harmoniscs suppression.

After placing a 47pf cap I read about -45dB on the second harmonics with the UV-3r. Sounds a lit better to me.

Higher harmonics read about 50dB where the VX-7 has at least 5 db more suppression.
I also hooked up the mobile icom radio I have here it also shows around -55dB.

Maybe the baofeng interacts differently with the used antenna then the VX-7. Maybe it is fun to try an other antenna with the VX-7 and baofeng and see how many yards the signal will travel.

Regards,

Edwin PE1PWF

I'm making a portable ground plane antenna for UV-3Rmk2. I'm using Zack W1VT's design published by ARRL. The core of that antenna is a UHF SO-239 female chassis connector. I desire a 3ft lead with SMA male to UHF male to connect UV-3R to the antenna.

Which coax would be the best choice for this short run, RG142, RG58, or RG8?

Would the choice of coax be different for higher power (say, my FT-817nd)?

Hugs,
Della

Hi All

Some time ago I made up some cables for programming the UV3R and they worked fine. I then sketched up a diagram and put it up on www.uv3r.com. Fine and dandy.

Back from holiday I then made up another cable and tried to programme a MK2 serial number 3110719839, which failed to load or read. I tried another radio and another TTL converter, still no go.

Then I swopped over the RX & TX connections and it worked fine.

Is it me and did I make a mistake in sketching up the original diagram; or are the MK2 cable connections different?

At that length the connectors have more loss than the cable...and since this is most likely being used on the UV-3R flexible would be best for a light radio...could get a bit hard to handle with more rigid cable with stress on the radio's antenna connector...

Lee...or anyone else...have you heard of or used a tiger tail? And has anyone analyzed the performance with one? If you haven't heard of a tiger tail....it's just a 1/4 counter poise for 2m and 70cm coming off the ground side of the antenna mount by using and is supposed to help in transmit and receive, but I have never made any bench analysis to determine if this is theoretical or proven....There is a great two part you tube video that shows how to make a dual band one from zip cord/speaker wire....in fact it makes two at the same time....I was board and made two and found that I did notice a bit of an improvement on receive but really didn't bother with asking for signal reports with it on and off...I ended up throwing it in my go bag for possible latter use...
If anyone is interested inthe video I can try to find it and put a link on here....

Subject: RE: [UV-3R] Which is best for 3ft lead RG142, RG58, RG8?

I used RG-174 for short runs. I used a chassis mount SMA connector for the center of my ground plane with 1/8” brass rod for the radials. I then screw any HT antenna to the top of it like the NA-701 or NA-666. If I put the antennas directly on my antenna analyzer I get bad readings but when I put them on my little ground plane the readings are pretty good.

Subject: [UV-3R] Which is best for 3ft lead RG142, RG58, RG8? I'm making a portable ground plane antenna for UV-3Rmk2. I'm using Zack W1VT's design published by ARRL. The core of that antenna is a UHF SO-239 female chassis connector. I desire a 3ft lead with SMA male to UHF male to connect UV-3R to the antenna.

Which coax would be the best choice for this short run, RG142, RG58, or RG8?

Would the choice of coax be different for higher power (say, my FT-817nd)?

Hugs,
Della

Be careful bending coax...it can create signal loss and seriously reduce the cables efficiency especially at 70cm....signal runs on the outer edges of the center conductor and bending too much or kinking can disrupt that...

Subject: RE: [UV-3R] Re: Which is best for 3ft lead RG142, RG58, RG8?

To relieve stress on the radio connector I bent the coax 180 degrees in a narrow loop and attach it to the side of the belt clip with a short piece of Velcro cable wrap. RG-174 is very flexable. From: UV-3R@yahoogroups.com [mailto:UV-3R@yahoogroups.com] On Behalf Of john zenick

Subject: [UV-3R] Re: Which is best for 3ft lead RG142, RG58, RG8?

Obviously, the larger the coax the less loss. It this situation I think convenience is the issue (only 3') the 142 is more flexible and easier to use. Next choice would be 58.....Hal, WB4AEG --

Yes, my rule of thumb is "don't bend or fold. Instead, gently roll a 1-ft loop". And I don't tape 'em together, I rubber band 'em. Loose velcro catch works too. That way, a pull-stress causes the loop to slip and doesn't transmit the yank along to the connector. Another approach is to slide 180deg loop up through the pants belt (I picked that trick from a Genuine Hollywood Sound Man who was always walking too far with his boom from the stationary recording device).
Hugs,
Della

I've never heard of using a counterpoise, or tiger tail, for 2m or 70cm. That's interesting. Most handhelds don't use one.

I purchased the 10-meter MFJ antenna created for my Yaesu FT-817 and a counterpoise is recommended for it's use, but I've not made one yet. This 10-meter telescoping antenna (MFJ-1810, I think) fits on the front antenna mount (with either the radio vertical or using a 90-degree bnc adapter). I haven't tried it yet, but it seems like it may be a good 10-meter solution for portable use--but it DOES apparently require the tiger-tail wire for optimal peformance. (MFJ also makes other antennas like this for the FT-817.)

Interesting about the suggestion for 2m or 70cm use.

Lee...or anyone else...have you heard of or used a tiger tail? And has anyone analyzed the performance with one? If you haven't heard of a tiger tail....it's just a 1/4 counter poise for 2m and 70cm coming off the ground side of the antenna mount by using and is supposed to help in transmit and receive, but I have never made any bench analysis to determine if this is theoretical or proven....There is a great two part you tube video that shows how to make a dual band one from zip cord/speaker wire....in fact it makes two at the same time....I was board and made two and found that I did notice a bit of an improvement on receive but really didn't bother with asking for signal reports with it on and off...I ended up throwing it in my go bag for possible latter use...

If anyone is interested inthe video I can try to find it and put a link on here....

I used RG-174 for short runs. I used a chassis mount SMA connector for the center of my ground plane with 1/8" brass rod for the radials. I then screw any HT antenna to the top of it like the NA-701 or NA-666. If I put the antennas directly on my antenna analyzer I get bad readings but when I put them on my little ground plane the readings are pretty good.

Darvell....If you haven't already you should try some of the buddipole stuff...they sell and nice 91/2 foot telescoping antenna with 3/8 24 thread...it's light and strong...and yes and equal length counterpoise should be used...there are also coils that you can use for other vertical configurations and you can run multiple wires for the bands you are working. there are a couple of good groups for that....I better mention the UV-3r in this post so I don't get in trouble...
That UV-3r is a snazzy little radio...I always thought that those tiger tails were kind of a gimmick when sold in magazines for 20 bucks....but when you can make one your self with stuff laying around in the shack...if you get a little better receive and can make a repeater that was marginal before...why not!

well, the best would be LMR400, or hardline, but those probably aren't very practical. Out of the three you mentioned, RG8 would have the lowest loss, but a 3 foot run isn't going to have allot of loss even at UHF frequencies, so the 58 or 174 would probably be fine.

If you buy from China, there's a 2-4 week delay (China post to HK clearing to US clearing to US mails) and it is *possible* that Customs will decide to slap an "import tax" on your order. Rarely happens, but not unheard-of. Or you could opt for DHL/FedEx and get 'em faster. Or you could call up your local dealer and pay sales/VAT tax and a surcharge to the middleman. I purchased through "i-talkie" for the radios (lowest price at the time), but use "solidradio", "BOBO", "409" and several others for various parts. I shop based on price+shipping.

I notice that *most* of them have the name "Wingwah Chan" stamped on the back of the package for return address, all at the same confectionary factory in HK. I'm not making that up, that's where "101" is located (cooking stuff). The hand-applied postage stamps have also been very lovely to look at. Every single stamp has been different, sometimes 3-4 per package. I've never seen a stamp repeated on all the packages I've received from China. How do they do that?

I'm of the opinion that Honorable Wingwah Chan is fronting for his grandchildren in their entrepreneurial endeavors, and personally sees to it that none of them bring dishonor to the family. Several times I've found an interesting "gift" tucked into a package. Not often, but when one is, it's "just a bit different".

Communications with all, and speed in which they get the order packaged and delivered to Hong Kong post, has been excellent for me.

The mails,however, still give meaning to "Slow Boat From China."

Hugs,
Della

I have bought UV-3R Mk2 from a couple of different sellers on Ebay.

There wasn't much to chose between them on price and both dispatched promptly and well enough packed, however I noted the following minor points :
Seller "mega409shop" gave me a Hong Kong Post tracking number and also supplied a charger with the correct pins for UK power fully integrated. Oh, and a free pen ;-)
Seller "solidradio" didn't give a tracking number and the charger supplied was the twin round-pin "euro" type even though I am in UK. They did however supply a tiny adaptor to enable this to be connected to UK mains supply (like many I've seen from HK, unfused so probably strictly illegal in UK but it does the job)

So mega409shop just gets my vote as a UK buyer.

3392. Piano wire for counterpoise?

Yahoo group: UV-3R (2011)
Date: 2011-11-23 03:09:22 UTC
From: dellaaxim
Topic: 3392 Message: 3392

Lee made an antenna "using a SMA coax connector and a thin piece of piano wire and a little bit of heat shrink tubing." (post 1201). Hmmm, gets me to thinking that instead of Lee's brass rods for counterpoise/quadpod, how about using piano wire for counterpoise(s), then suspend the antenna from its tip? (Of course, put 1/2" loops at all ends to deal with the poking problem). I see two physical advantages using all piano wire:
1. Difficult to bend the counterpoise(s) when bumped.
2. Disconnect the lead, remove the counterpoise(s), and it's a very compact set of 5 wires that will slip into a lightweight tube for travel.
But will piano wire serve well electric/magnetically?
Hugs,
Della

1. I use RG58-U/A, B or C. It is stranded and the center connector does not break after being bent several times. I place a SMA to BNC adaptor on the radio. I have BNC on all my short cables. This allows for a quick connection and disconnect. I also have a BNC to UHF adaptor when using larger coas. When camping with BSA I have been known to Carry a 4 element beam with 20 foot pole and 20 foot of RG58. All in a small 3 ft canvas bag. The antenna and pole are all aluminum so as to reduce weight. This adds a lot of range to my HTs.
2. For shorter communications I use a RD-98. http://www.eham.net/reviews/detail/1268 It has gain on both 144 and 440. Sometimes for a little more boost I use a 1/2 inch metal tape measure cut to 1/2 wave on 144 and solder a AAA metal battery end clip in the middle. This will snap on the base of my RD-98. All my RD-98s have exposed metal on the connector. The ground plan has to be connected to the metal ground. Clipping it to the bottom of an insulated connector on the antenna does nothing to the signal. - Jerry

I offer a precaution message here:
when I went to the link stated above

> http://www.409shop.com/shop_displaynews.php?id=292

and downloaded "Install FreeRAR Extract Frog" my AVG2012 came up with a virus warning for that .exe file. I chose to delete the file and get a winrar extracter from some other source. I'm not about to risk mucking up my computer to program UV-3R. Convenience never trumps security.

Hugs,
Della

I've downloaded this "Frog" program and sent it to virustotal.com.
Onyl McAfee complains, here is the scan result:
http://www.virustotal.com/file-scan/report.html?id=87c0df65265e519d93e8f97f54acc73ad2d929e65ee56f5cdc7f91935c1919e0-1290577816

Anyway there is a lot of free and trusted softwares available which can open RAR files (7-zip for example, http://www.7-zip.org/), so it must not be a problem for everyone who need to unpack the file from 409shop.

Anyway, the UV-3R is 100% clean as you can see the scan result from virustotal.com:

http://www.virustotal.com/file-scan/report.html?id=a586ee42bc818c330a5944b142e15be6a1d62c83a042dc463c261174acf7a1ef-1322050774

I'm personally downloaded and installed this software from this source and neither my AV (Bitedefender 2012) told me something.
For me, it is ok to use it.

Where can I get programming software that will limit transmit to 144-148 MHz? Every version I have found only has the 144-146 Mhz option.

Get the RAR extractor from the source rather than 409 shop....

http://www.free-rar-extract-frog.com/free_rar_extract_frog.php

Neither AVG or Avira flagged this download for me.

3402. Second harmonic, how bad is it really in practical use?

Yahoo group: UV-3R (2011)
Date: 2011-11-23 15:00:40 UTC
From: john_kb0ne
Topic: 3402 Message: 3402

Hi all,
Yesterday I heard one of the locals ranting on how the UV-3Rs are such a "violation" of of the FCC emitted radiation specs because of the second harmonic from 148 mhz... but I don't think he may have taken one thing into consideration.

I haven't seen any discussion in this forum if anyone has actually done RF range testing on this radio using a good 150 mhz only or dual band antenna and actual calibrated test gear.

Sure there is a strong second harmonic at ~-40 some db down when measuring into a *50ohm dummy load*... Things might actually look a lot different on ab RF test range with the HT using an antenna.

Considering that there is going to be a high VSWR at the second harmonic with a non resonant antenna... (reflected power not getting emitted...) Just how hot is the second harmonic?

And yes, I do realize different antennas will have varying amounts of VSWR at the second harmonic. Then again it may have been the intention of the manufacturer that using separate resonate antennas (early UV-3R 2 antenna packaging) on the desired bands would be part of the second harmonic filtering process....

Who knows... perhaps it is even worse.

Just some thoughts

John KB0NE

3403. UV-3R on Vail Mountain, Colorado - Key up our HAM club (K0RV) and say Hi!

Yahoo group: UV-3R (2011)

From: skierinavon
Topic: 3403 Message: 3403

Bring your UV-3R on your Ski vacation this year!

The (SCARC - ski country amateur radio club) invites you to key us up and say 'CQ' via our club's HAM repeater on

the top of the mountain in Vail, Colorado. (Tx 146.010Mhz, Rx 146.610Mhz, PL107.2)

2 watts works just fine from Vail's famous back bowls to the top of the mountain.

Continuing with item 2 below. The Steel tape is stored in a round snuff box or boot wax can. Coil it up into a 2 inch circle and place in can. When removed it springs to full size. I have not done a ¼ wave for SMA yet but have one for BNC and several fire department personal have for their commercial radios. While on a lost child hunt the fire men found they could not communicate back to base with the HTs. One who is also an amateur radio operator went back to his truck and replaced his rubber duck with the tape measure ¼ wave antenna. He than relayed all communications from the others to base. - Jerry

This allows for a quick connection and disconnect. I also have a BNC to UHF adaptor when using larger coas. When camping with BSA I have been known to Carry a 4 element beam with 20 foot pole and 20 foot of RG58. All in a small 3 ft canvas bag. The antenna and pole are all aluminum so as to reduce weight. This adds a lot of range to my HTs.
> 2. For shorter communications I use a RD-98. http://www.eham.net/reviews/detail/1268 It has gain on both 144 and 440. Sometimes for a little more boost I use a 1/2 inch metal tape measure cut to 1/2 wave on 144 and solder a AAA metal battery end clip in the middle. This will snap on the base of my RD-98. All my RD-98s have exposed metal on the connector. The ground plan has to be connected to the metal ground. Clipping it to the bottom of an insulated connector on the antenna does nothing to the signal. - Jerry

From: Chris KF8ZR
Topic: 2107 Message: 3407

Anybody know if there is a solution for the receiver cutting out?
I get it only on 2 meter repeaters at times but I'm not sure if there is something that stops this.
I haven't used the software yet just program using the keypad and knob.

3408. Re: [UV-3R] Second harmonic, how bad is it really in practical use?

Yahoo group: UV-3R (2011)
Date: 2011-11-23 22:57:47 UTC
From: colin McDonald
Topic: 3402 Message: 3408

last week Andy posted some real world findings comparing a stock UV3R mk I, an LPF modified UV3R mk I and a yaesu VX7.
All using the same model of dual band antenna.
the posting is in the archives...but essentially the unmodded UV3r faded out on the second harmonic at 200 yards, the modded UV3R faded at 150 yards, and the vx7 faded at 220 yards using the same kind of dual band antenna and 2 watts or so.
He set it up as equally as possible and used a good FM receiver to check.
You can check yourself by tuning a receiver to the VHF frequency multiplied by two (288-296MHZ), to hear the second harmonic.
I wonder if that guy ranting and raving about the non-FCC compliant second harmonic emissions was using a yaesu handheld like the vx7...
I'd certainly like to see someone try out one of each of the top selling big three handhelds along side the uv3r, unmodified, and post the results...I'll bet they would be surprising.
I also have a sneaking suspicion that a dual band HT, or tri-quad band HT would tend to have more second/third harmonic emissions than a monno band VHF HT...just my thoughts.

Regards
Colin

Same here, Front end overload from adjacent signals I suspect.

I placed my thumb up beside the antenna to limit the overload and the repeater cuting out comes good. 70cm doesn't seem to have the same noise that appears to be generated near 2m.

As an example on a shopping mall roof on 2m the thumb on the antenna works a treat but not required on 70cm. The more overload the higher you move your thub up the side of the antenna. I had the same problem when I plugged the radio into the cars 1/4 wave vertical.

QST December 2011 on page 44 under Technical Correspondence has a test of the UV-3R done by Bob Allison, WB1GCM of the ARRL Lab.

Testing of the second harmonic was done with a HP-8563E spectrum analyzer. According to the ARRL lab, the two UV-3R units they tested failed to comply with FCC Rule 97.307(e) (spurious emissions).

Of course one should read the entire results to see the details.

3414. Re: [UV-3R] Second harmonic, how bad is it really in practical use?

my own practical testing is below

All tests done from one end of my house to the other clear line of site(~60 ft)

UV-3r tuned to 146MHZ and transmitting with NA-775 antenna would in any orientation go off squelch on 438MHz

UV-3r tuned to 146MHZ and transmitting with stock VHF antenna would in most orientations go off squelch on 438MHz(if i stood in between the ht it would not go off squelch)
IC-T2H tuned to 146Mhz and transmitting with stock "rubber duck" antenna would in any orientation go off squelch on 438MHz

Not sure what this shows except when I tried to take the NA-775 off one of the UV-3r's I have I could not it started unscrewing the SMA connector on the radio!

Subject: Re: [UV-3R] Second harmonic, how bad is it really in practical use?

last week Andy posted some real world findings
comparing a stock UV3R mk I, an LPF modified UV3R mk I and a yaesu
VX7.
All using the same model of dual band
antenna.
the posting is in the archives...but essentially
the unmodded UV3r faded out on the second harmonic at 200 yards, the modded UV3R faded at 150 yards, and the vx7 faded at 220 yards using the same kind of dual band antenna and 2 watts or so.
He set it up as equally as possible and used a good
FM receiver to check.
You can check yourself by tuning a receiver to the
VHF frequency multiplied by two (288-296MHZ), to hear the second
harmonic.
I wonder if that guy ranting and raving about the
non-FCC compliant second harmonic emissions was using a yaesu handheld like the vx7...
I'd certainly like to see someone try out one of
each of the top selling big three handhelds along side the uv3r, unmodified, and post the results...I'll bet they would be surprising.
I also have a sneaking suspicion that a dual band
HT, or tri-quad band HT would tend to have more second/third harmonic emissions than a monno band VHF HT...just my thoughts.

Regards
Colin

Hi John,

Actually 32 dB or less below the carrier (worse a.k.a. higher).

> Things might actually look a lot different on ab RF test range with the HT using an antenna.

Of course, but in the context of the rules, this is irrelevant for conducted emissions.

> ...there is going to be a high VSWR at the second harmonic ...
> Then again it may have been the intention of the manufacturer that using separate resonate antennas (early UV-3R 2 antenna packaging) on the desired bands would be part of the second harmonic filtering process....

Nope. Conducted is conducted, not radiated.

> Who knows... perhaps it is even worse.
> Just some thoughts
> John KB0NE

John,

There is no perhaps in this case. The antenna has no bearing on Conducted Emissions.
The radios tested are not in "violation" of FCC rules. They *are* in violation of both Part 90 and 97. I have verified that several of those taking measurements, and reporting them here, have done it correctly. In addition, it is the responsibility of licensed amateur to do sue diligence to keep his/her equipment within the rules.

Following are excerpts from my response to another ham who was very worried about this harmonic issue.

...

Yes, it appears that these radios surely exceed the accepted limit for the second harmonic and by a very uncomfortable amount. Yes, it is true that they could cause interference to a receiver that is receiving *precisely* on the harmonic frequency and if it is rather close

by.
And they do indeed violate both the Part 90 and 97 rules. If the rules are carefully read, the antenna has no bearing on the spurious conducted out the antenna connector. Units in the field have been tested to more than 44 dB worse than the unit tested to receive Part 90 Certification. There is some kind of a production change either intentional or accidental. Either way they *are* in violation. Driving on a isolated road at 30 or 40 miles over the limit is a violation...endangering others is another matter.

I found out about these radios only a few weeks ago and they use an extremely new and exciting technology (engineering-wise). I've had a hard time resisting getting one or two myself. However, it burns me as well that they are made in China *and* have this problem. It's just another example of cheating on the western rules. That is why, along with the fact that certification was one of my major responsibilities - even more-so as a manager - that within a few days of hearing about this, I contacted the ARRL to take their temperature on it. I honestly wonder why no one else had.

I am sure you realize that on one hand there is the letter of the law, and that meeting it is greatly desired for the common good (in the ideal sense anyway) yet there are times when we must exercise some practical judgment, or pick our battles, so to speak. If it weren't for this we wouldn't have things like warnings and, perhaps plea bargaining. Guilty is guilty, right? However, giving a violation for 2 miles over the limit would usually be considered folly.

If you've been reading the Yahoo UV-3R group, you should have read that the probability of one of these radios actually interfering with another important communication is very remote. I base this opinion on some 39+ years of professional experience and the preceding 10 years, or so in my youth of self study in electronics and radio.
I worked for Motorola where we took this seriously and worked hard to get things right and to follow not just the letter of the rules, but make performance that met any more strict practical aspects as well. We were also in a position of creating some of the spec limits now commonly accepted.

I contacted the ARRL to get their take on it and to see if anything was already being done and it appears there is, but just. The enforcement branch also has to pick its battles.

The limit on this type of "spurious emission" essentially covers everything outside the radio's normal transmit modulation bandwidth -regardless whether there is any significant possibility of interference or not. This in itself is a very strict requirement, but it allows using a radio without consideration of any outside factors. However, I can feel somewhat more comfortable knowing that in this case, the probability is low. Of course, if I succumb and get one, I have the ability to fix it and would.
...
...
The other side of this is that interference is not a 'fixed level' phenomenon either. A radio that meets all limits can easily still interfere under some conditions.

The limits on things like this harmonic are chosen given a wide universe of conditions to pick from and not all radios will be in an environment that is conducive to interference.

SO... With all that blabber, what are my recommendations...
1 - Contacting your distributor and tell him what you know about the radio and ask what the story is from his end. The more they hear, the more pressure we apply and the sooner this will get resolved.

2 - I am sure there are some locals in your area that could do the fix on your radio. Ask around. It is ok to get it fixed - obviously depending on what the distributor says. This issue is compounded by the low price of the radio. Yes, I know this isn't "right", or "fair", but as Lone Star said in Space Balls; "Welcome to real life."

Finally, I would not be afraid to use the radio. You can certainly listen without fear. If this is your only VHF/UHF radio, listen to the locals as a minimum. I would transmit. You may feel uncomfortable, as I would, but there is this very low probability factor.
In the remote chance that there was some interference, the first thing that would happen is that someone would say "cut that out, PLEASE". Your response would be, "Gee, I have a certified radio here, but I'll get it checked." This is highly unlikely, I assure you, based on the frequency.

Will,

Can you explain what you imean by "going off squelch"?

There also seems to be some typo in that last sentense:
" ... I could not it started unscrewing the SMA connector on the radio!"

My reading inserted a comma between "not" and "it" to read "I could not,
it (the antenna) started unscrewing...".

Sorry that last sentence got mangled.

When I tried to take the 775 antenna off one of the uv-3r's it unscrewed the connecter from the case instead. I dabbed some superglue on it and rescrewed it so it is fine now.

Hi!

> 1 - Contacting your distributor and tell him what you know
> about the radio and ask what the story is from his end.
> The more they hear, the more pressure we apply and the sooner
> this will get resolved.

I ordered one of the non-Mark-II UV-3Rs from Hawaii Radio Sales (the shop that has the baofeng-uv3r.us web site) a couple of weeks ago. I received the December QST a few days later. I e-mailed the shop, asking what they knew about the situation. First response - the UV-3R meets Part 90. That's all. I replied that it didn't seem right that a ham shop - in this case, according to their web site, "Hawaii's Ham Radio Store" - would sell a radio that did not meet the *Part 97* requirements, even though it met Part 90 or some other part of FCC Rules. I was then told I could return the radio for a refund, if I had everything that came with the radio including the plastic sheet across the LCD display (something that came off when I started using this radio). I told him that, and then I was told I could still return the radio even without that plastic sheet. I sent the radio back last week, and it arrived back at the shop on Monday. The credit for the radio showed up on my credit card today.

Although I was not happy with the initial response from the shop, they did the (IMO) right thing when I complained about the radio's performance as tested in the QST article. Maybe some other radio - maybe the UV-X4, or something else - will come out that complies with Part 97 in that price range. It could be possible, following what the Wouxun radios have done in the past year or so.

a little concerned here as i love my mtc uv-x4 and want at lest 4 or 5 more for spares but i am worried that if too much pressure is put on this little radio that either one they will discontinue it or stop sales here in the usa or the price will go much higher so with that not to make anyone mad but remember this is an affordable radio with short range in mind and i hope we can keep price low and having them for sale here in the usa, to always know there at reach when needed!

One more thing. If the repeater asserts a PL tone on output, don't bother using PL decode on the UV-3R. It's not implemented robustly and will also cause continuous audio drops.

did QST do a test and article on any of the yaesu, kenwood, icomm, alinco radios, or is it assumed that they all meet FCC part 97? Was the UV3R singled out because it was made clear from the very beginning of sales, that there was an issue on the second harmonic on VHF, and that the manufacturer used a pretty weak work around by using a mono-band VHF antenna. Whereas, there is never a peep from the big 3 and others about their second harmonic emissions.
Even though it is quite clear from recent findings that a yaesu was in actual fact, worse than the UV3R at the VHF second harmonic.
I've also not heard about the findings with the wouxun...though I'm not on any of the wouxun lists...so perhaps some enlightenment here?
You send your UV3R back, yet you probably own a vehicle that can exceed every posted speed limit...
The UV3R still functions great on UHF and is still good value if you only use it there.

> this will get resolved.

I ordered one of the non-Mark-II UV-3Rs from Hawaii Radio Sales (the shop that has the baofeng-uv3r.us web site) a couple of weeks ago. I received the December QST a few days later. I e-mailed the shop, asking what they knew about the situation. First response - the UV-3R meets Part 90. That's all. I replied that it didn't seem right that a ham shop - in this case, according to their web site, "Hawaii's Ham Radio Store" - would sell a radio that did not meet the *Part 97* requirements, even though it met Part 90 or some other part of FCC Rules. I was then told I could return the radio for a refund, if I had everything that came with the radio including the plastic sheet across the LCD display (something that came off when I started using this radio). I told him that, and then I was told I could still return the radio even without that plastic sheet. I sent the radio back last week, and it arrived back at the shop on Monday. The credit for the radio showed up on my credit card today.

Although I was not happy with the initial response from the shop, they did the (IMO) right thing when I complained about the radio's performance as tested in the QST article. Maybe some other radio - maybe the UV-X4, or something else - will come out that complies with Part 97 in that price range. It could be possible, following what the Wouxun radios have done in the past year or so.

Actually, I posted a message here recently about the UV-3R, the Wouxun KG-UVD1P and the Yaesu VX7-R. I have all three and the UV3R was the only one that failed. -31dBc on the second harmonic and no noticeable readings on my spectrum analyzer from either the Wouxun or the Yaesu. I admit that it was not a scientific test, but it convinced me that the UV-3R is not compliant for amateur radio use.

In reality, I don't see this as posing a big problem of interference except if someone decides to set up a remote hilltop APRS packet digipeater, etc.using a UV-3R radio. Connecting the UV-3R to an external gain antenna on a hilltop might cause some interference that will be noticed by the users of the 290MHz spectrum.

So are you saying that an external antenna with gain would have gain at
both 145MHz and 290MHz? Surely, any antenna worth its salt that's resonant
at 145MHz would be way way down (i.e. substantial negative gain) at 290MHz?
Or are you envisaging the use of a poorly designed antenna? :)

ARRL has also tested other radios, and testing for spurious emissions is part of their testing process. If you are an ARRL member and registered on the ARRL web site, you can read reviews from past QST issues at:

http://www.arrl.org/reviews-listed-by-manufacturer

If you have received the December 2011 QST, you can see that the UV-3R "review" was not done as a normal QST review, but listed as "technical correspondence". It is possible that ARRL looked closer at the UV-3R, since it is not from one of the big 3 or 4. They may have done the same thing with the Wouxon HTs last year, but found they met the FCC rules. The UV-3R "review" has several paragraphs about the 2m transmitter not meeting the FCC rules, but only a single sentence stating that it complies with the rules when operating in the 70cm band. The review does not mention if ARRL went back to the manufacturer or any of the distributors/importers to see if there would be any changes to bring the 2m transmitter in compliance with the Part 97 rules.

> I've also not heard about the findings with the wouxun...though
> I'm not on any of the wouxun lists...so perhaps some enlightenment
> here?

ARRL had a review of the Wouxun KG-UVD1P and KG-UV2D HTs in the November 2010 QST issue. It is available from the link above, if you are an ARRL member. You probably didn't hear a lot about that once those radios received FCC certification and started showing up from stateside shops and sold at the Dayton Hamvention in May 2010, since they met the requirements regarding spurious signal and harmonic suppression. What else could ARRL say at that point - don't buy Wouxon, buy from one of the other companies that advertise in QST? That review cited suppression in excess of 70dB for both 2m and 70cm with the KG-UV2D ARRL tested for the review.

> You send your UV3R back, yet you probably own a vehicle that can
> exceed every posted speed limit...
> The UV3R still functions great on UHF and is still good value if
> you only use it there.

Your comparison with a vehicle is off the mark.

My vehicle complied with all requirements for new vehicles
imported and sold in the USA at the time of its manufacture.
If some part of it did not meet the USA regulations, the
manufacturer would be obligated to recall the vehicle and
make the repairs necessary to comply with those regulations -
something that can happen many years after the vehicle was
manufactured or originally sold.

The UV-3R may meet FCC Part 90, but in the way most are marketing
it - as an amateur 2m/70cm FM transceiver - it does not comply with
all of the FCC Part 97 rules based on the ARRL "review". Being
able to drive fast is how I would be using my vehicle, and
a close analogy to the radio would be if I chose to use a UV-3R
to transmit outside the ham bands where I am not authorized to do
so - or transmit on 2m, knowing that there were spurious emissions
not in compliance with FCC Part 97.

I could have kept the UV-3R as a 70cm transceiver with a 2m receiver.
But that's not what I wanted from that radio. I was hoping to get
a small 2m/70cm HT that I could possibly use on the satellites.
The current group of FM satellites (AO-27, AO-51, and SO-50)
require ground stations to transmit on 2m and listen to the
satellite downlink on 70cm. With the software and cable, it was
no problem to progam the memory channels the way I needed them for
the satellites. After reading the QST "review", I decided that this
radio would not satisfy what I was hoping to use it for. It's a
shame, as it would have been nice to put together this radio with a
homebrew 2m/70cm Yagi and have a station capable of working the
satellites for around $50. Maybe the UV-X4, or some other variant
of the UV-3R, will do better with meeting the FCC Part 97 rules.

> there at reach when needed!

I've thought about getting a UV-X4 myself. The documents submitted for its FCC certification (also per Part 90, like the UV-3R) say it is a derivative of the UV-3R. With that, the manufacturer did not have to do as much testing of the new radio. It would be nice to see someone take a UV-X4 and do some of the same testing for harmonic suppression as has been done by ARRL and others with the UV-3R.

As for buying 4 or 5 as spares... at those prices, I would rather buy one transceiver that I didn't need to keep spares on hand in case of a failure. Spending $260 or $335 (MTC's price for 4 or 5 UV-X4s) would get you a pretty nice 2m/70cm HT, or a Kenwood TH-F6A triband HT.

It would be nice if the UV-X4 met all the Part 97 rules, especially at the price I've seen it at. But, using the car analogy another posted tried to use as an analogy with the UV-3R situation, there are many cars that are not sold in the USA. Lots of smaller cars, and some larger ones. They do not meet all of the USA requirements for new vehicles to be sold here, so the manufacturers/importers do not bring them to the USA market. Time will tell - soon, hopefully - if the UV-X4 (or even the Mark II version of the UV-3R) does any better with suppressing harmonics from the transmitter than the UV-3Rs tested by ARRL.

Using the car analogy doesn't hold water for me either. The UV-3R passed the test, then the filter capacitor was removed to improve performance for Part 97. Using a car analogy, that would be like a car passing the EPA standards for emissions, then selling the car without a modified exhaust system to improve performance.

My comment on using a gain antenna on a hilltop was not clear, my apologies. What I really should have said is that and external antenna would cause a stronger signal than the rubber duck antenna.

If I remember my theory correctly, An end feed half wave antenna would have an impedance of about 3,000 ohms compared to 50 ohms for a quarter wave end feed antenna. This would equate to SWR of 1:1 at 144 MHz and 60:1 at 290 MHz for an antenna tuned to 144 MHz. When the impedance is matched you get maximum power transfer. - Jerry

I just received 2 mark 2s and I just checked one of them on my HP8920B. At 144.5 the second harmonic was down 38db. This is about 10 db better than my mark 1.

I have not measured the mark 2 in 1 mhz steps like my mark 1 but at my fire 1 156.195 the second is down at -55 db and it is about the same as my 1.

By the way, my mark 1 is spurious at 136mhz as if it mattered and at 138 the second is only down about 10db.

W4ATK, for you to give such a resounding No I'm certain many would be thankful in a little enlightenment as to the tests that you know of that have been conducted, and the serial number of the particular UV-3R Mk II? This would help in future discussion.

The reason I ask? It now transpires that two brand new Mk IIs have been tested by *drayer* and the second harmonic is substantially reduced.

I'm certain that you wouldn't wish to give the Mk II an unneccesarily bad name so we would all be interested in the details of the particular Mk II rig tested.

similar thing happens with uv3r, but it does not show channel names.
I guess you can just ignore that column ?

You can activate this column and write names inside.
Usefull as reminder in the software.
Useless in the radio.

It's the same for the UV-3R software.
I don't think that feature is available, if it can be activated, pray
tell.

3443. Re: Second harmonic

Yahoo group: UV-3R (2011)
Date: 2011-11-26 16:56:37 UTC
From: satellitboy
Topic: 3435 Message: 3443

I can confirm that the 2nd harmonic suppression has been IMPROVED in the UV-3R MK2 (serial number 3110721402):
I have measured values of -38 dBc in HIGH and LOW power settings at all frequencies between 144 and 146 MHz.
The 2nd harmonics are at its worst at 136 MHz (-35 dBc) and almost invisible at 173 MHz.
In addition, the output power in LOW power setting is approx. 700 mW on all VHF frequencies between 136 and 173 MHz which is also a welcome improvement!
The power in LOW power setting is much lower in the older models and very depending of the frequency. For instance I have measured 60 mW at 145 MHz on some older models!

I also have noticed a 'quirk' on UHF in the new MK 2 model: the power level in LOW is approx. 200 mW ABOVE frequencies of exactly 430.000 MHz, and approx. 800 mW BELOW 430.000 MHz!! The harmonic suppression is fortunately not affected: it is approx. -55 dBc at its worst (both in LOW and HIGH power setting).

So my conclusion is that the output circuit has, indeed, been modified, and it looks like some changes have been made to the output stage (bias?) to prevent higher harmonics on VHF at low power settings.
I could not find any differences in the filter section (no added or deleted components or layout changes). However, I cannot verify that the inductance/capacitance of some components have been changed.

The change in the UHF power level at the crossover frequency of 430 MHz is very strange: the older models do not show this phenomenon.
The harmonic levels are not affected, so what's the reason for this level 'jump'??

I will receive another UV-3R MK2 next week, and I will make some measurements on it as soon as I received it.

Unfortunately the audio level modification has not been taken care of, so I had to change the famous resistor in the audio circuit similar to the method used in the older models.

From: sandyandhero2002
Topic: 3444 Message: 3444

I had my UV3-R attached to a J-pole ant. After a day or so I could not make any contacts so I blamed the J-pole. I decided to put a rubber duck ant back onto the UV3-R and

The ant connector on top of my UV3-R came out completely.

Can this be repaired? How?

Thanks,

Sandy/KF3D

Try this: (This is the way it works for my UV-3R software)

Locate the settings.ini file for the programming software. it should be the same places as the executable. Mine is in \Program Files (x86)\UV3R

Change the entry name=0 to name=1

Restart the programming software.

Like they said, you can use it as a comment for the entry, but it is only 4 chars long though.

the internal cable is still attached right?

If so I had the same after using the na-775 for awhile what I did was put some super glue on the thread and screw the connector back in. That will be a permanent fix though as I don't think I will ever be able to get the connector out again.

I don't think the internal cable is still connected because the whole little round metal connector came off the top of the rig and there is a short metal pin/?wire coming out the bottom. I was able to screw it back on but the ant is obviously no longer working..

I'm a little confused...when I took the UV3R apart, I thought I remember seeing that the SMA connecter was designed where the outside shaft, where the threads are, comes up through a hole in the metal mass of the heat sink, then there are two small screws that go through and secure the flange to the underside of the plate where the threaded shaft goes through? Perhaps I miss remember, but how does the connecter come right out if it is hard mounted to the heat sink like mine is? Doesn't seem physically possible.

Regards
Colin

Two things:

1 - $8 or so will get you a new plastic case delivered. A 3 month
old baby could do the repair job.

2 - Not sure how much of the antenna came out ? But let's hope
the centre pin hasn't ripped out from the PCB and buggered up
the through plated hole :-(

The SMA connector felt "wobbly" and finally part on top of the rig unscrewed and coming out from the center beneath it is was a short bent metal wire.

Try Chirp.
You can pull the data from the UV-3R and then program the x4

Although chirp doesn't specifically address the x4 I'm guessing the
software is generic enough.

gotta be worth a shot.

3462. notes on new MkII

Yahoo group: UV-3R (2011)
Date: 2011-11-27 20:47:26 UTC
From: bartvanallen@gmail.com
Topic: 3462 Message: 3462

Just received serial number 3110726120 a couple days ago -- ordered from radioshop888 via Ebay 11-16, shipped 11-17, received 11-25 Wow, that is only 8 days, much faster than expected. Ordered programming cable with it, total was $54.88 including shipping. Package was well wrapped and great looking stamps.
Downloaded program from Baofeng website to get initial programming done before it arrived. It all seems to work as expected with some notes:
The LED (Brits call it the Torch)/FM button is only working if just the right spot is pressed, not a general button area press like the Function or PTT buttons. But it still works.
The charging cradle does not have two coaxial power plugs for cascading as earlier ones do. But since I find it easier to just use the cradle as a holder while the charger is plugged into the radio that is no big problem, and I'll likely use the cradle to charge any extra batteries if I ever get them.
The programming software did not program the FM memories, but this is no big deal since I don't intend to do much listening of that band and they are easy enough to do manually.
Looking at the pictures of the radio I thought it would be a very small thing. But I was surprised at just how small it really is! The speaker mic for the old Yaesu HT is larger than the Baofeng.
I can hit many local repeaters on low power, with only a few requiring high. I haven't received a report on voice quality yet, no rag chewing done, just "ka7zfd radio test" so far --
Also, the connector for the lanyard came apart and will not stay together. No problem, as I would have used it only for hanging an ID card from and I have plenty of others.
Thank you Tom PA2TSL for the great report on the harmonic testing. It looks like mine is a later serial number, so I'll assume it is OK, and I have no way of testing anyway.
In summary, there seems to be some improvements, and there are still poor quality things that prove just how inexpensive it really is.
Now to find a resistor for the volume fix.
So far, it seems well worth the half C note --
Bart ka7zfd

I can hit many local repeaters on low power, with only a few requiring high. I haven't received a report on voice quality yet, no rag chewing done, just "ka7zfd radio test" so far --
Also, the connector for the lanyard came apart and will not stay together. No problem, as I would have used it only for hanging an ID card from and I have plenty of others.
Thank you Tom PA2TSL for the great report on the harmonic testing. It looks like mine is a later serial number, so I'll assume it is OK, and I have no way of testing anyway.
In summary, there seems to be some improvements, and there are still poor quality things that prove just how inexpensive it really is.
Now to find a resistor for the volume fix.
So far, it seems well worth the half C note --
Bart ka7zfd

I was one of the first to know about this change .. almost since its release the new software V.1.07.
My radio "Baofeng uv3r" works, from 130 to 260 MHz and 400 to 520 MHz

Do you know how to change the FM radio? It 'can be used from 76 to 108 MHz, but I can not program it with the software.

I await news,
goodbye

3468. UR-3R programming pl tones and offset

Yahoo group: UV-3R (2011)
Date: 2011-11-28 22:30:48 UTC
From: Ronald
Topic: 3468 Message: 3468

Greetings. I come as a beggar to the banquet. I received the '3R today and thought that I had done enough homework to be well prepared-- was wrong.

The manual on page 17, referencing TX CODE, made it sound like that by the turn of a dial I should simply set a tone. But I do not grasp how to turn TxCODE on from OFF-- I rotate the dial, etc... nothing happens, it just stays off.

Its unlikely anything in wrong with the rig... what am I failing to understand?

tnx,

KC6VHU.

After the menu item is selected you need to press U/V before the knob
will change the setting.

Ronald,

Are you programming it manually? There is also a programming cable available and computer software that makes programming a little easier.

If you're programming it manually,
hit "menu" turn dial to "transmit"
press UV key and then turn dial to desired PL tone number
press PTT to save
For Offset again: press menu
go to "offset"
hit UV key, dial up desired offset
hit PTT

There is a very helpful FAQ in the files of this group in the files.
This is explained pretty well on page 9 of FAQ

73s

3472. Cannot connect to radio

Yahoo group: UV-3R (2011)
Date: 2011-11-29 13:41:05 UTC
From: Bob B - KJ6MOS
Topic: 2825 Message: 3472

I just got my uv-3r yesterday. Mine came with the mini plug to serial cable and software. Anyway, I've got a USB to serial adaptor and verified that it works by pluging my Icom IC-92AD in and reading the live radio data.

After that, I plug the baofeng radio in, and the com port shows active. I fire up the updated uv-3r software and set the active com port. When I try reading the radio, it returns with "unable to communicate with radio". I've tried it on two computers, (both macs running windows under boot camp.)

Any advice?

Bob - KJ6MOS

Are you certain you've pushed the 4-pin plug into the UV-3R fully home?
This is the usual problem - it's in the FAQ which is worth a good read over
a coffee.

It may look like it's fully home but is in fact a mm or two out, which
makes the difference.

Hope this helps,

.d. G4TUP.

I found that the cable supplied did not completely plug into the radio.
Removing a little bit of the material off the rubber plug shell allowed
it to go in all the way.

Joe

.

Hello

This worked to open up my uv-3r,to 520, as that is as far as I tried.

Thank you very much for the info.

Jay

3476. Re: [UV-3R] receiver cutting out

Yahoo group: UV-3R (2011)
Date: 2011-11-29 17:42:25 UTC
From: N7LN (Darvell)
Topic: 2107 Message: 3476

I had the idea of using the really short stubby antenna to drop the gain. My favorite local repeater causes the receiver to drop out ALL OF THE TIME on both my UV-3R's and Mark II, which I obviously find very annoying.

Has anybody tried the stubby duck? If not, perhaps I'll order one to try.

Darvell

Anybody know if there is a solution for the receiver cutting out?
I get it only on 2 meter repeaters at times but I'm not sure if there is something that stops this.
I haven't used the software yet just program using the keypad and knob.

Hi Darvell. Haven't you asked that repeater keeper to turn the deviation down yet? :) Perhaps some others are having problems too with the overdeviation sidebands affecting the squelch, but not mentioning it. I would have thought he may be thankful to know of a possible problem that he'd want to investigate? Worth the phone call....

BTW, changing your antenna won't make the repeater better :)

Also, I dug out my TRIO 2200GX the other day after a long period of non use and tested it. I had the UV-3R about four feet away to monitor the Trio's transmission, and it didn't cut out once with the strong signal, as it shouldn't.....

Best of luck and regards, David G4TUP.

Date: 2011-11-29 18:02:31 UTC
From: Joel Lambert
Topic: 2107 Message: 3478

hello people I have tried over time many different brands of stubby antenna's and the only one I fould to work is one for about 21 bucks from ebay the url is:

http://www.ebay.com/itm/390237289645?ssPageName=STRK:MESINDXX:IT&_trksid=p3984.m1436.l2649

it works just fine on 137-175 and 400 - 470 as good on receive as a long antenna \\

hope this helps good luck joel

3480. USB cable driver

Yahoo group: UV-3R (2011)
Date: 2011-11-29 18:33:12 UTC
From: bartvanallen@gmail.com
Topic: 3480 Message: 3480

I had installed the driver found in the Files section (PL-2303) and have had a series or crashes with the computer, fatal errors. After uninstalling it, no more crashes. I just installed the newest driver from the Prolific website, v 1.50, and will report IF there are any more crashing problems.
http://www.prolific.com.tw/eng/downloads.asp?ID=31
Are there any others that have had this problem? I'm running XP sp3 32 bit --
Any other proven safe driver solutions?

3481. Re: USB cable driver

Note -- I did see the post by Gerrit dated Nov 9 2011 saying it does not work, and the newest driver from Prolific is dated a couple weeks earlier -- not sure if they are the same driver version -

>happens, it just stays off.

You've just entered the first stage of menu navigation. You've made it to where you cycle through the menu categories, I see. Good so far. Now, in each category/menu item, (such as 1. Tx Code, 2. Rx Code, etc., you can then drop down to the parameter you want to change (and back) with the U/V key. This moves the little arrow from Menu Item to
Parameter In Question. And back again. With the arrow on the pram, rotating the knob cycles through the pram options. Once you've got the one you want (eg, tone frequency),
then the U/V key will take the arrow back to the menu item no., and it also saves the pram choice for you. And now, rotating the knob cycles through the menu items once again. eg, to item 2. Rx Code, 3, SQL level (of which 5 and 0 are the only real choices).
It's confusing, at first, but what else could they do without a full keypad? It's kind of ingenious, really..
When you've cycled through all the menu options, setting and saving by U/Ving to the next option in each case, pressing the Menu key will take you back to the vfo screen. Or just let it time out and it'll go there by itself.
I certainly haven't got it all figured out yet, but the U/V arrow change is the first step you need to understand. Hope this helps.
ps VE7EKF

Gratitude to you, et al the other respondents. You were helpful, the pls worked once I got something into memory, but not exactly as you said. For a hot minute I sort of got it and succeeded in entering 3 freqs and keying up the machines in mem mode. Then I did the famous "something" and everything went to hell. Now I can't remember my way back and all has reverted to mess.

I'm an attentive reader, the little booklet is well-done-- but apparently something is presumed or omitted.

Thank you each for the generosity of your time.

'VHU

I am not so sure the booklet is all that helpful. Again take a look at the FAQ and also look at the cheat sheet called Cheat BIG.jpg. Very helpful.

Hi Group,

Has anyone measured the sensitivity of the reciever in these extended bands?
Also on other radios I have been told the Tx dropps quite a bit out of band.

It may be worth putting a modified radio though some tests to see how it
behaves. For me the extended range would enable UHF CB.

Shaun

From: bartvanallen@gmail.com
Topic: 3480 Message: 3491

neither version (1.5 or 1.4.--) worked from the Prolific website. Went to google and found driver version 4.0.100-- and that works. No crashes yet, will advise.
Side note - Once basic programming is done with Baofeng software, then Chirp works better. The main difference is Chirp does not have basic setup or config options, but is easier to use since it has copy/paste and multiple setups with tabs as well as importing data from various sources. Even tried copying one bank from one of my scanners (programmed with Chirp) to test it -- nice!
Also, Chirp allows just setting offset, not entering separate transmit freq.

3493. Is this the cheapest UV-3R MkII !

Yahoo group: UV-3R (2011)
Date: 2011-11-30 16:41:38 UTC
From: DavidN
Topic: 3493 Message: 3493

A mate of mine came round today to see my MkI and to see how small it is,
as he's interested in one. He brought a printout from Ebay and I've never
seen them this cheap before!

£28.06 incl.P&P (equates to $43.80 USD)

Blue are the same price.... :)

http://www.ebay.co.uk/itm/UV-3R-BAOFENG-UV-3R-136-174-400-470Mhz-w-FM-88-108-/130603093743
?pt=LH_DefaultDomain_0&hash=item1e688d0eef

.d.

the ONLY way to compare prices is "in-the-hand" - ie, delivered and taxed (if applicable) prices. Is shipping included?
I bought mine at the best price at that moment including shipping, and the diff between the top few sources amounted to only a dollar or so -- remember that some advertise some goodie or another as enticements -- but you do pay for them somewhere

Mine was $65us with an extra $10 battery included. It came with the usb cable, program software disc, two antennas, strap, case, and even a free pen. Ooops also the charger. That is $65 to the door in 10 days or less.
John

Topic: 3468 Message: 3502

>Then I did the famous "something" and everything went to hell. Now I
>can't remember my way back and all has reverted to mess.

Binderdondat! There's always the Ace In The Hole: Restore to Factory Setting: hold power and VOL buttons down for 5 seconds, and it reverts to virgin. I had to do that the other day, and shortly after that, I found that my problem had been that I had it on lock, - this by inadvertently holding down the MENU button for too long, (short punch gives Menu, longer hold gives LOCK! Nice!) and all I'd have had to do would have been to see the teeny little lock icon, and play with MENU(/LOCK) until it came off! LOCK locks the F/A and U/V buttons, which pretty well stops you dead.

Suggestion: print out the Cheat Sheet in the files section and tape it to your shirt front.
Also download the latest pdf faq and keep it in your computer. You'll need them both for awhile! (g)

Figuring these things out is just like shooting pool. God figured out a way to help you get better. The worse you are at it, the more practice He arranges for you! It's a marriage made in Heaven! (Or have I got my directions and personnel mixed up?) 8-)

Never Give Up!
ps/ekf

At 01:40 AM 11/30/2011, you wrote:
>I am having problems setting up my rig When I go to menus 2 I cannot
>change the value setting even though I am pressing the U/V key

Just tapping the U/V key should toggle the arrow to top or
bottom. Tap the arrow down to the bottom, and then rotating the top
knob (pulled to unlock, of course) should toggle you through the
options for Tx tones.
ps

sometimes you gotta stab that V/U button pretty stoutly to make it operate.
Try pressing it harder to activate the sub menu.

I am having problems setting up my rig When I go to menus 2 I cannot change the value setting even though I am pressing the U/V key
I wonder have I locked some settings accidentally it would be much appreciated if anyone can help.

Topic: 2107 Message: 3505

That doesn't sound good.

What I need is an antenna that has good SWR on transmit, but a fairly high attenuation on receive.

There's no way to set attenuation in the software, is there? I hate to handicap my radio to eliminate overpowering signals on receive.

The SWR is so high on them you have to wonder if you would harm the radio by using them.

Hi

Maybe more details please? What did you changed, .ini file?
I translated source page into English but there is not a lot how to achieve this.
Best

Greg

Hi Bart, as I said, it's £28.06 including P&P, and in the clickable link I quoted, looking there shows the P&P part of the £28.06 total price is £6.99.

Actually, the exchange rate has changed slightly (they quote in dollars on a British site for some strange reason!) so today it's not quite as good value.... :(

With version 1.07 you can change the frequencies of FM radio.
With V.1.09 is impossible.
This software has many bugs.

The procedure was written in another post.
http://groups.yahoo.com/group/UV-3R/message/2968
Do not expand from 60 to 490 MHz, the radio receives approximately 128 to 260MHz, and 390 to 520 MHz
Remember that the performance degrades to the bandwidth limits.

Hello,

I did the translation of the web page and got the following:
==========
Open in the frequency range MarkII Did UV3R

Mensagempor John on Thu Dec 01, 2011 04:49
Good has been a fruitful morning, there is much to see questions about whether it would be possible to open the frequency range of the UV3R and decided to get to work ...
Not only is it possible to expand the frequency of rx / tx and put under the frequency display to receive UHF also, thus making VHF + UHF, VHF + VHF, UHF and UHF + VHF + UHF.

Regarding the expansion of the higher frequencies will be 498.995 MHz will be possible because the frequency from 499 to appear on the display is 4-0000. For lower frequencies have not done yet is of great trials which enables safe to 220 MHZ.

Here are some pictures of the tests performed in this long night
==========

Unfortunately, a lot seems to have gotten lost in the translation from Portuguese to English, maybe someone can clarify it? The project sounds interesting, especially regarding 220MHz. I would like to receive on that band.

Hi guys, some more tests I made, it is not possible to have the same combinations unfortunately. We have to choose between:
VHF+VHF and UHF+VHF or VHF+UHF and UHF+UHF.

But the good news is that is possible to expand to:

118-389,995 MHZ
391-498,995 MHZ

hello.
first of all, thanks for an interesting forum, - i've enjoyed lurking in the backround for the past few months.
i bought a uv3r a few months age just out of curiosity, and something to play with, - ive never had/used ham radio or cb or anything of its like before.
so want to ask you nice people for guidence where to start.
i live in the uk, so where do i stand re. licences and the legal stuff.
if i was to use a couple of uv3r only for personal comunication between family members how does that affect licencing?
what freq. are best for personal communication uses? (in uk) (e.g. should i use PMR freq.?)

and secondly can anyone recommend internet sites that would help me start into and understand the ham radio world better (especially uk)?
i have an electronics backround so am willing to get technical :-)

thank you very much for your time
Kevin.

Yes, but are you really where the LCD tells you? Have you tried receiving a 222 frequency? Or any known frequency outside of the usual range of the radio? I would really shy away from attempting to transmit outside of the range also.

Hi Kevin. Firstly, welcome to the group!

I'm in the UK but don't know an awful lot about PMR frequencies. However, I have heard that there are some channels available around 446MHz for anyone to use without a licence. Try googling that to get you started.

Re. amateur radio in the UK.... there is now the Foundation Licence. As you have an electronics background I'm certain you'd find taking the exam easy. You study yourself, then over a weekend there is a course. At the end of the course on the Sunday afternoon you take the exam, and it is marked straight away and you get to know there and then if you have passed. I've been one of the instructors on this course and so far everyone has passed. If you have a little bit of nouse you'll pass! Then you send your pass paper to OFCOM and usually receive your callsign (which you can select) within the week. Then you can go on the air! Most HF bands up to 10w are available, and the VHF/UHF bands.

Here are the details:

http://www.rsgb.org/arls/foundation_licence.php

There are many courses throughout the year.

The above site will also tell you about all the facets of amateur radio!

Hope this helps and enjoy!

David G4TUP.

From: bartvanallen@gmail.com
Topic: 3506 Message: 3521

Notes on set-up;
Per CT2HPM determined rx limits, I played with the following band definitions on my MkII setup lines used in Config file:

freq2=[118-389/391-498]
data2=8011993810398949

Using version 1.07 Baofeng, version 0.1.12 Chirp -- these notes may change with other versions - please post any results and updates on this neet stuff!
Set VOX to OFF [0] to keep sound of turning encoder knob from keying the radio (guess how I know this)
Chirp does not allow entering freqs out of standard radio band edges if radio is set to UV-3R, leave at generic when entering info.
Radio will not allow setting tx/rx tone codes in 220 band (perhaps same on other bands, not tested),
Baofeng software will allow setting tones.
Chirp will not upload with out of (nominal factory config ranges anyway) band stuff.
I can hear 220 repeaters, but I cannot bring them up. Not sure if poor ant match (likely), too low power (how far below nominal 2 watts is it transmitting?), or what, but the TX lite gleams and I can RX there.
Lots of QRM/birdies in the lower 440 range (391-420 or so) -- Some may be computer/monitor hash?
Scanning thru these the Freq display shows (going up at 5k Step) "199.995" to "1--0.000" and continues to ""1A0.000" thru to "1D9.995" before going to "200.000" and then repeats it from "299.995" to "2--0.000" and then on to "2D9.995" to "300.000" and starts over at 118.00 after it hits 389.995 --
I don't know what that is, I don't have the means to test it.

Anyone have a way to test more on 1.25 meter band?

Bart KA7ZFD

Yes -- Receiving 1.25 meter repeaters fine. Repeater ID shows the radio is where the LCD says I am. Cannot bring them up tho --

The trick is to have the lower display in one monitoring freq, the upper one in Memory, not VFO, mode with a vhf freq or repeater in it, that way you have vv available.

The chip used in the radio has support for 222 in the datasheet. I'm sure the RF components are not optimized for it though. What little filtering exists and also the PA. I'd be careful you don't damage the radio by transmitting. I'd be afraid there's a mismatch in the circuitry since it wasn't designed for that. I wonder if anyone will end up blowing TX on their unit by trying this?

Jetstream has a mobile as well...most don't bother because the frequencies are not a typical HAM band except in the states and has not been used all that frequently here except in bigger metropolitan areas like here in the SoCal area.
Wouxun has a mobile that is going to be a dual bander but can do either or on 440 or 220 software user definable, so you can decide what two bands you want out of the 3 144/220/440 at least this is what Wouxun was planing...it has not made it to the US yet....Jan or Feb ETA right now, but the radio was supposed to be here last October at one time.
It would be nice if all these radios were set up the same way or just tribanders. it seams they have the capability but it maybe less than optimal in this range.

Hi Kevin
You don't say where you are located, but to find a club or instructor who run foundation courses look on the RSGB website. http://www.rsgb.org/arls/foundation_licence.php if you can't find any course provider there, then send an email to rce.dept@... Rebecca should be able to pass on your detail to a local trainer. With regards to the PMR 446 the UV3 radio will operate on those frequencies but to do so is illegal, the 446 radios have a close specification which includes not being able to transmit more than 500mw and must have a fixed aerial not a removable one. PMR 446 radios are available at about the same cost as a UV3.
Hope this has helped

To start a Scan of frequencies stored in your UV-3R try this...

Quckley Press the middle button on the left side (right below the PPT button).
Now you should see a small "F" on the LCD display. Once you do...
Next press the MENU button the front. UV-3R should start scanning.

Verify that your UV-3R is in the memory channel mode..such that turning the top knob moves you through each different memory location.

Works for me!

I tested my MKII.
I was able to transmit :
From 131.5Mhz to 275Mhz
From 400Mhz to 524.285Mhz
Using this settings, frequency control become somewhat buggy.
Using 131.5-199.895 and 400-499.895 ensure correct frequency settings.
I tested using my AOR-8000 to check that voice is correctly transmited.

Here is my settings.ini :

```
[setup]
com=2
searchcom=1
name=1

language=english

[ModelInfo]

Freq0=[136-174/400-470]
data0=6013401700400047

Freq1=[131-200/400-500]
data1=1513991900409949
```

Erm, since we know that the harmonic of 145Mhz is supposed
to be about 30db down, then it stands to reason that the 220Mhz
power output is probably going be 20+ db down as it passes the
same filter.

I think if anyone wants to use this rig on 220Mhz then they had better
start looking at a complete re design of the on board filter, along
with the possibility of losing 2m in preference to 220Mhz.

The latter I suppose depends upon what can be done with a filter
rebuild.

However as a general purpose receiver it has it's merits, including
the fact that nothing actually needs to be rebuilt at all ;-)

Topic: 3546 Message: 3546

Any one else had this?

In the tx freq I enter 146.1000, I hit enter and I get 146.1001?

Similarly I enter say 147.7000 and get 147.6999.

I fixed it in the radio then read the radio back and it adjusts the software version to the correct numbers.

The UV-X4 is the same radio except it does crossband full duplex and has an enhanced USB interface.

Other than that it is the same radio, right down to the housing.

I would not expect changing the antenna will correct this problem so to prove it I finally got around to connecting my UV-3R to my HP8920A test set. As expected, the signal strength had no effect on the radio until it was low enough for normal squelch operation. I took the level up to −20dBm with no problems at all. This is what I would expect on any FM receiver. I also tried over deviating the signal and that also did not cause the squelch to close at high signal levels compared to lower levels such as −100dBm. With the frequency set 5KHz off requency, again the signal level had no effect on the squelch operation.
The only way I could simulate what Darvell is experiencing was to set the radio to the narrow setting. The squelch then would close at over 4KHz deviation but this was not affected by signal strength, only the actual deviation.
There is no way you will find an antenna that has a good SWR on transmit and high attenuation on receive as such a thing cannot exist! There is a way though and that is to use an attenuator in the connection between the antenna and radio. This will not fix the problem as others have also said in their replies to this thread. This is not a signal level problem!!
Darvell, have you confirmed the radio is not set to the narrow setting? This is the only way I can replicate the problem.

Subject: Re: [UV-3R] Re: receiver cutting out

That doesn't sound good.

What I need is an antenna that has good SWR on transmit, but a fairly high attenuation on receive.

There's no way to set attenuation in the software, is there? I hate to handicap my radio to eliminate overpowering signals on receive.

Darvell (N7LN)

I'm certain it doesn't have X-band repeat, so I'd be interested, Cowthief, where you got this from.

The only difference are the shape of the buttons on the front, they're shaped like a tear drop.

From: DavidN
Topic: 2107 Message: 3554

Funnily enough, Grant, I did get this problem on my Mk.I the other day for about five minutes, then it went away.

The situation was that I was listening at home to a repeater about 45 miles away at 5.6. Two operators were having a QSO which lasted about thirty minutes. Neither were overdeviating, and as you can see the signal was not ultra strong at all. I was on wide setting and using a quarter wave whip.

During their QSO, without myself or them changing anything, the squelch started to randomly close for about a quarter second. This was approx. every twenty or thirty seconds, but as I say, at random.

I've never heard this before on this rig, so what could it be? In this area of North West England all taxis use data, not speech, to communicate with central control. Could a close, idling taxi at 156MHz (I think) be strong enough to upset the rig? Or even, a police car, ambulance, coastguard etc be the culprit?

It's certainly odd I've not had it before, nor since... So, could mine and Darvell's problem be 'noises off'? :)

It could be something like that. Being an SDR receiver there could be some strange effects especially with off frequency signals. Thje squelch is a bit strange to what we are used to with the usual analogue devices we have used for years. Have a listen to the audio when the squelch opens at very low signal levels. The frequency response of the audio seems to be limited, especially at the high frequency audio. Once there is speech on the signal, it sounds normal. The radio does respond differently to a data signal as well, such as the data stream on a trunked system control channel. I assume the demodulation of the FM signal is also done under software in the receiver IC so this could explain the unusual effects. What it does show that I think Darvell is heading in the wrong direction by assuming his problem is due to too strong a signal and looking for a different antenna. If high signal strength is the problem, simply unscrewing the antenna so that it doesn't make contact with the centre pin but still sits on the radio will cause a large loss of signal but there should be enough leakage to still receive the signal. I would like to see the results of this simple test.
I don't use mine for monitoring over a long period of time but under normal communicating use I've had no problems.

You can check to see if you are in VFO or Memory mode by the memory channel number displayed in the upper left hand corner of the display. Perhaps if the memory and vfo are on the same freq, there may be some confusion of which mode you are in. Just a thought --

Maybe you have the squelch set too high? Try setting it lower and see what happens. As you are quite a way from the repeater conditions may change occasionally and weaken the receive signal.

VE7EKF,

This has been a maddening experience. Your comments were useful and appreciated-- but if only that passage on the manual's page 17 under TXCODE were true as written! It isn't, it just "don't do what its 'sposed to do".

For drill and out of stubborness I have managed to back into the question and have succeeded in getting 4 freqs put into memory-- and they work! Trouble is no matter how I

trace my steps, replicating them seems to be a happy accident.

I can buy another unit in a hot minute-- and might but the same situation could obtain (I'm whining). But almost always I find that there is something that I have not grasped.

You've been generous; a ham radio operator... how we all aim to be.

tnx OM.

Hi! Think this was really in response to the squelch shutting on a repeater 45 miles away for about 5 minutes randomly?

Well, I have the squelch set to position 1, and as I mention in the FAQ after tests, positions 1, 2, 6, 7, 8, 9 are all the same level, and they allow weak signals through, whereas positions 3, 4 and 5 are the same and don't allow weak signals through. This is on a Mk I version.

I can understand your thought that conditions may change, but the signal strength from the repeater was the same throughout, as were the signal strengths from the ops into the repeater. This is why I feel this problem is caused in my situation from transmissions off frequency but strong and not voice, as the squelch cut out was only a quarter of a second each time. Possibly in the ham band but also possibly a *mobile* professional service using data.

As I've never had this before or after I feel it's the latter but it'd be interesting to hear from others who've had this problem and can go into depth on their thoughts.

Regards, David G4TUP.

Exactly. Until I see either another radio receiving on the same freq. or a frequency counter hooked up, I'm kind of wary about it.

Booby, I agree completely. All that this vid shows is that the the PLL can lock to these frequencies and show them on the LCD, and not that the circuits of the rig will allow these frequencies through.

and going down to 118 is pretty pointless unless you can get AM, which you can't on the UV3R.
The ICt2H has something similar where the PLL will lock down to 100MHZ, but will not hear a damn thing below 136MHZ.

Hi David,

Yes, the type of problem you are seeing where the UV-3R squelch is taken out for several seconds has the appearance of mobile data bursts. There is an "Autocab" system in the same site as our local 2m repeater which runs on high band VHF and works as you surmise when polling taxis. Another old favourite is pagers, some of which can run quite high power compared to the normal LMR/Commercial PMR systems.

I would have thought that the UV-3R would suffer when presented with high levels of signals such as experienced near communication sites, so took mine with me when checking our local 2m repeater recently. All the normal amateur H/H I own fall down with overloading on the site or anywhere near as there are multiple towers and many sources of interference. My dual band mobile starts to suffer within about 1/2 mile from the site. It was quite a surprise that the UV-3R seemed during the time I was on site to be unaffected, though was a Sunday afternoon where radio traffic may be lower. Will check again in on a weekday to be sure when the chance comes up.

The squelch operation on the UV-3R is different to all other radios I have with a definite time lag to open, but seems to be adequate otherwise.

There has been comment about the squelch closing when a wide deviation transmission is received by a radio that has narrow filters in place. This is quite normal and expected as the instant the deviation goes beyond the bandwidth of the RX IF filter, the squelch see this instant as loss of signal and will automatically close for a short period. Had such a receiver in our local repeater and was dubbed by the locals as "the Norman Collier effect". The Brits in this group will be aware of where that came from!

Unlike the USA, 2m repeaters in the UK and believe Europe are obliged to run narrow deviation of not exceeding 2.5kHz deviation as we moved to 12.5kHz channel spacing in year 2000 to double the number of repeater channels. As a result there is a tendency to employ surplus LMR/commercial PMR radios which conform to this standard. In any case the licensing authority in the UK have obliged the repeater keeper (owner in USA terms) to sign a declaration that at least the TX complies with this standard. During an audit of our local 2m repeater a few years back by the licensing authority the RX was checked also to see that it also conformed. Many older repeaters may not do so being constructed from older 25kHz spacing equipment which was widely available as surplus at one time.

For what it costs the UV-3R is brilliant in what it does. Would guess the shortfalls on performance will be corrected over a period of time, but earlier versions can be corrected with simple modifications if the reported effect disturbs you. Doubt if most can even see or measure the problem anyway!

Regards,
Bob, G3VVT

Another thought -- it does sound like squelch clamping, so maybe check to see if you have RX codes on or if you are in narrow mode -- try no rx codes and wide bandwidth --- perhaps you already are, but like I said, just a thought --

Agreed for the most part.
I DO receive the local 220 repeaters, great audio too. Sorry I don't have video for this.
But -- although the red LED lights up on TX, listening to a scanner set on the same freq (using simplex for the test) shows there is no RF output. So it DOES receive way out of bounds (at least on the 1.25 meter band) but it does not transmit. I assume the main processor programming could be changed somehow, but that would also indicate a new filter/rf amp would be required as well for those freqs.
Oh well, I would get the Wouxun if that really mattered much ---
The larger problem is the programming setup as I have mentioned before. It takes a combination of UV-3R and Chirp programs going back and forth to even get it working as it is.
Perhaps the owner of the Chirp program could allow greater input of the radios set-up parameters?

From: N7LN (Darvell)
Topic: 2107 Message: 3574

I agree, this directly was probably the wrong one to solve the problem with the receiver cutting out on my UV-3R's.

Last night, I asked about this issue on the Utah Amateur Radio Club net, which club owns this repeater. I gave a few suggestions on what I thought might be causing the problem, and was told that they do not believe the repeater itself has a problem with it's output, as they have put test equipment on the repeater recently and what they have seen looks good.

So, it does NOT appear that the output of the radio is overloading the receivers on my UV-3R's and thus causing the receiver to cut out.

Of course, they initially suggested some of the things we've already discussed, like checking the narrow/wide settings, but the guy whom I was talking to (who seems very educated on the subject) came to the conclusion that the problem was due to the radio's squelch clamping. I must admit that I'm not sure what that means, although he explained it a little bit to me. I need to do some Internet research on the topic before I really understand what he was suggesting. I told him that the problem goes way when I turn down the squelch such to the point where I hear static and he said that further suggests that it's a squelch clamping issue. So, from what he said, I have no solution to the problem yet, assuming that the squelch clamping is the problem, but I plan to look into it.

So, thanks for your input, Grant. I don't know how to solve this issue, but perhaps I am heading down the correct path now. I welcome your comments on this "new path."

Subject: Re: [UV-3R] Re: receiver cutting out

It could be something like that. Being an SDR receiver there could be some strange effects especially with off frequency signals. Thje squelch is a bit strange to what we are used to with the usual analogue devices we have used for years. Have a listen to the audio when the squelch opens at very low signal levels. The frequency response of the audio seems to be limited, especially at the high frequency audio. Once there is speech on the signal, it sounds normal. The radio does respond differently to a data signal as well, such as the data stream on a trunked system control channel. I assume the demodulation of the FM signal is also done under software in the receiver IC so this could explain the unusual effects.
What it does show that I think Darvell is heading in the wrong direction by assuming his problem is due to too strong a signal and looking for a different antenna. If high signal strength is the problem, simply unscrewing the antenna so that it doesn’t make contact with the centre pin but still sits on the radio will cause a large loss of signal but there should be enough leakage to still

receive the signal. I would like to see the results of this simple test.
I don’t use mine for monitoring over a long period of time but under normal communicating use I’ve had no problems.

Subject: Re: [UV-3R] Re: receiver cutting out

Funnily enough, Grant, I did get this problem on my Mk.I the other day for about five minutes, then it went away.

The situation was that I was listening at home to a repeater about 45 miles away at 5.6. Two operators were having a QSO which lasted about thirty minutes. Neither were overdeviating, and as you can see the signal was not ultra strong at all. I was on wide setting and using a quarter wave whip.

During their QSO, without myself or them changing anything, the squelch started to randomly close for about a quarter second. This was approx. every twenty or thirty seconds, but as I say, at random.

I've never heard this before on this rig, so what could it be? In this area of North West England all taxis use data, not speech, to communicate with central control. Could a close, idling taxi at 156MHz (I think) be strong enough to upset the rig? Or even, a police car, ambulance, coastguard etc be the culprit?

It's certainly odd I've not had it before, nor since... So, could mine and Darvell's problem be 'noises off'? :)

.d.
G4TUP.

On Sat, Dec 3, 2011 at 3:42 AM, The Simpsons <grant@simtronics.co.nz> wrote:

>
>I would not expect changing the antenna will correct this problem so to prove it I finally got around to connecting my UV-3R to my HP8920A test set. As expected, the signal strength had no effect on the radio until it was low enough for normal squelch operation. I took the level up to −20dBm with no problems at all. This is what I would expect on any FM receiver. I also tried over deviating the signal and that also did not cause the squelch to close at high signal levels compared to lower levels such as −100dBm. With the frequency set 5KHz off requency, again the signal level had no effect on the squelch operation.
>The only way I could simulate what Darvell is experiencing was to set the radio to the narrow setting. The squelch then would close at over 4KHz deviation but this was not affected by signal strength, only the actual deviation.
>There is no way you will find an antenna that has a good SWR on transmit and high attenuation on receive as such a thing cannot exist! There is a way though and that is to

use an attenuator in the connection between the antenna and radio. This will not fix the problem as others have also said in their replies to this thread. This is not a signal level problem!!

That does indeed sound like the problem I am experiencing. It's not all of the time, but with my local repeater, it's a large portion of the time. It seems random. I'll be fine for awhile as I'm listening to QSO's on the repeater, then all of the sudden, it will start cutting out in mid-conversation. Generally, mine was more frequent than every 20 or 30 seconds, tho; more like every 5 seconds or so, but again, not regularly. Like you say, it appears to be random (but probably isn't, LOL--something is causing it).

I did finally ask the repeater owners about the issue last night, which is detailed in my other email on this topic.

Subject: Re: [UV-3R] Re: receiver cutting out

Funnily enough, Grant, I did get this problem on my Mk.I the other day for about five minutes, then it went away.

The situation was that I was listening at home to a repeater about 45 miles away at 5.6. Two operators were having a QSO which lasted about thirty minutes. Neither were overdeviating, and as you can see the signal was not ultra strong at all. I was on wide setting and using a quarter wave whip.

During their QSO, without myself or them changing anything, the squelch started to randomly close for about a quarter second. This was approx. every twenty or thirty seconds, but as I say, at random.

I've never heard this before on this rig, so what could it be? In this area of North West England all taxis use data, not speech, to communicate with central control. Could a close, idling taxi at 156MHz (I think) be strong enough to upset the rig? Or even, a police car, ambulance, coastguard etc be the culprit?

It's certainly odd I've not had it before, nor since... So, could mine and Darvell's problem be 'noises off'? :)

Another thought. What setting is the squelch set to? I always run mine at 1. I will do some checks on the other settings when I get the chance.

Subject: Re: [UV-3R] Re: receiver cutting out

That does indeed sound like the problem I am experiencing. It's not all of the time, but with my local repeater, it's a large portion of the time. It seems random. I'll be fine for awhile as I'm listening to QSO's on the repeater, then all of the sudden, it will start cutting out in mid-conversation. Generally, mine was more frequent than every 20 or 30 seconds, tho; more like every 5 seconds or so, but again, not regularly. Like you say, it appears to be random (but probably isn't, LOL--something is causing it).

I did finally ask the repeater owners about the issue last night, which is detailed in my other email on this topic.

3577. Modding a UV-3R MkII

Yahoo group: UV-3R (2011)
Date: 2011-12-05 19:03:30 UTC
From: Tony
Topic: 3577 Message: 3577

Hi all,

Thanks to dd5xl, vittorio and others for info on fixing the low pass filter on VHF on this radio.

Got my MkII a few days ago and it has the same problem.

What may be of interest is a load of pictures in Photos\TonyWilks UV-3R:
http://groups.yahoo.com/group/UV-3R/photos/album/522296971/pic/916234572/view

which show some measurements before and after the fix.

Also there's a couple of files in Files > Mods > UV-3R_MkII_mod for use with LTspice to simulate the filter (LTspice is available *free* from Linear Technology at http://http://www.linear.com).
I used a simplified version of vittorio's schematic and doubled it up so I could get a before/after plot in simulation.

I ended up added 2 x 3.3pf, 1 x 12pf and added a turn to one of the coils.

The -3bB point for the carrier is now approx 172MHz, which leaves the UK 144-146 band 'untouched' whereas the spurious output at c. 290MHz is down to -51dB.

Yours,
TonyWilk

[QuickStart for LTspice:
File,Open UV-3R VHF filter.asc
Simulate, Run
Click on the blank output graph
Plot Settings,Open plot settings file - UV-3R plot settings.plt
clicking on the schematic adds more traces to the output plot
]

>This has been a maddening experience. Your comments were useful and
>appreciated-- but if only that passage on the manual's page 17 under
>TXCODE were true as written! It isn't, it just "don't do what its
>'sposed to do".

I for one agree with the maddening experience part. It helps to keep
reminding yourself how handy these things are (shirt-pocket size) and
how little you paid for it! 8-)

As for page 17, let me try rewriting it in my version of English:

TXCODE

To set a CTSS code for a given Xmit freq:

1) Get it into MENU mode by pressing the MENU button
momentarily.. Pressing for longer
will just put it in LOCK mode. You'll know when you hit it
right by being rewarded
with a display - RXCODE (menu item 1)

2) Once in Menu Mode, pull up the knob to unlock, and cycle through
the menu options
to item 2 TX CODE. The U/V button will cause the display arrow
to cycle up and down.
Cycle down to the bottom line (probably OFF to start) and then
rotate the knob to
find the TX CODE you want. Once you've chosen your TX code, hit
the U/V key again
to cycle the arrow back up to the menu option name
(TXCODE). You may then rotate
the knob through the other menu options, setting them the same
way for the freq with
which you're dealing. In each case, use the U/V key to get the
arrow to the top line
to cycle (knob) to the next menu item.

3) Once you're satisfied with the menu prams, a momentary pressing
of the MENU button
will get you back to the frequency display.

Pressing buttons requires a touch for how long as well as which
one. Much like using the mouse keys with your computer. Remember
when you had to learn the timing for a double-click? Same kinda
thing. Just a bit more than a touch of the MENU button cycles you
between menu mode and vfo display. Same thing for U/V to cycle
between memory and vfo modes. Too long and you end up in confusion

land. Watch for the LOCK icon! It's easy to lock it inadvertently,
and that can make you really crazy! (Don't ask! 8-))

Keep on keepin' on!
ps

3580. New to the UV-3r

Topic: 3580 Message: 3580

Hello Everyone
I just bought a UV-3r Mark II radio, I have pretty much figured everything out but I do have a few questions. How do I clear(Remove) Stored Channels in the memory? If its not possible to do so on the radio can I use the programming software with the USB cable through a computer to remove these Frequencies? And last but not least, Is the Software MAC friendly?

Thank you.

Sent: Monday, December 05, 2011 12:23 PM
To: UV-3R@yahoogroups.com
Subject: Re: [UV-3R] Re: receiver cutting out

I agree, this directly was probably the wrong one to solve the problem with the receiver cutting out on my UV-3R's.

Last night, I asked about this issue on the Utah Amateur Radio Club net, which club owns this repeater. I gave a few suggestions on what I thought might be causing the problem, and was told that they do not believe the repeater itself has a problem with it's output, as they have put test equipment on the repeater recently and what they have seen looks good.

So, it does NOT appear that the output of the radio is overloading the receivers on my UV-3R's and thus causing the receiver to cut out.

Of course, they initially suggested some of the things we've already discussed, like checking the narrow/wide settings, but the guy whom I was talking to (who seems very educated on the subject) came to the conclusion that the problem was due to the radio's squelch clamping. I must admit that I'm not sure what that means, although he explained it a little bit to me. I need to do some Internet research on the topic before I really understand what he was suggesting. I told him that the problem goes way when I turn down the squelch such to the point where I hear static and he said that further suggests that it's a squelch clamping issue. So, from what he said, I have no solution to the problem yet, assuming that the squelch clamping is the problem, but I plan to look into it.

So, thanks for your input, Grant. I don't know how to solve this issue, but perhaps I am heading down the correct path now. I welcome your comments on this "new path."

Subject: Re: [UV-3R] Re: receiver cutting out

It could be something like that. Being an SDR receiver there could be some strange effects especially with off frequency signals. Thje squelch is a bit strange to what we are used to with the usual analogue devices we have used for years. Have a listen to the audio when the squelch opens at very low signal levels. The frequency response of the audio seems to be limited, especially at the high frequency audio. Once there is speech on the signal, it sounds normal. The radio does respond differently to a data signal as well, such as the data stream on a trunked system control channel. I assume the demodulation of the FM signal is also done under software in the receiver IC so this could explain the unusual effects. What it does show that I think Darvell is heading in the wrong direction by assuming his problem is due to too strong a signal and looking for a different antenna. If high signal strength is the problem, simply unscrewing the antenna so that it doesn’t make contact with the centre pin but still sits on the radio will cause a large loss of signal but there should be enough leakage to still receive the signal. I would like to see the results of this simple test.
I don’t use mine for monitoring over a long period of time but under normal communicating use I’ve had no problems.

I have two UV-3R's here on my desk. One can take programming as you describe. The other, Menu 01 RxCODE and Menu 02 TxCODE cannot be adjusted with the knob. Menu 10 Offset, after setting, and coming back to it later, it has random digits added in front of .600, so that it reads 99.600, or 20.600, or some other added digits.

Yes, I did a reset.

I was instructed to return it to the seller for a replacement.

I am not sure where you are in your memory process, but when I got my radio it had a lot of unwanted frequencies stored. I did the Restore to default factory setting command (ON/OFF) + (F/ALERT). This clears all memories and all other settings. I did this on all of mine before programming them. - Jerry

From: Mike
Topic: 3590 Message: 3590

Hi All

I notice that Vero now have some "MKII" software in their site.....

http://www.verotelecom.com/download.htm

Or.....

http://www.uv3r.com/Index.html (at the bottom)

I have not had time to try it yet

Regards

Mike

From: Lynn W. Deffenbaugh (Mr)
Topic: 3468 Message: 3592

(Punctuated translation)

Well I bought one 2 weeks ago and programmed it via front of the radio. Here's what happened when a friend of mine bought two of them. We both bought the mtc uv-x4 from maintradingcompany.com for $65 shipped. He ordered two of them and they came in yesterday.

When I started trying to program them, i (?) on vfo b or bottom line, it wouldn't let me set the ctcss on his. Now keep in mind, on my radio it would but on both of his it wouldn't. What I found out is on vfo a top line, putting in the uhf there was no problem. Putting them in and the ctcss on vfo a would work. But when I went to vfo b, the ctcss wouldn't operate. What I had to do was:

1) Put in all the 2 meter stuff
2) Go back in memory's on the top line vfo a
3) Set the tones on each of the 2 meter freq's
4) Don't put them in memory but only go thru each frequency on 2 meter
5) Go to tx code on each programmed memory and setting the tone

Once you do that, just exit out of menu and go to the next memory channel. Go in to menu and turn the tx code to the tone it needs. Don't worry, it will keep a memory of what you set on each channel. You set tone on and don't try to overwrite the frequency. Just go to each channel that needs a tone, go into menu and set it them, exit only and repeat each one until done. Then just key the radio and it will retain what you set on each one!

I hope this will help. If not, email me at kd5ude@... and I'll try to help!

Your help is surely apreciated, and most of us thank you for it.

On the other hand, I gave up reading it, before reaching 1/3 of the text, because It was not understandable.

Maybe you are perfect (most of us are not) but your writing says otherwise.

You all try to be more perfect, by accepting our flaws and trying to be better at what we do.

That includes accepting critics (and sometimes buying proper computer keyboards).

I just downloaded it and tried it with my Baefong UV-3R, with no problems.

A couple of things I noticed.

The file is still saved as a .3R file.

After installing it and updating the settings.ini file, the first thing I did was read from the UV-3R to get my existing programming into the software. I noticed it had the NAME column populated. So even though there is no way to display it on the radio, the radio still keeps the NAME in internal memory. After the last round of discussions on the NAME col, I assumed it was only kept in the file on the PC and not in the radio itself.

rxcode and txcode will depend on your repeaters tones...and weather it has tones, or not. it'll be listed in a repeater directory at any rate.

I notice that this latest version allows you to store and program the FM radio frequencies too. Handy because otherwise you have to crank the FM frequency all the way up from 65MHz or so after any reset. I don't recall that feature on the previous version that I used (1.09), although perhaps I just missed it.
By the way, 1.10 does seem to work OK with Windows 7, 64-bit version.

I did experience some minor data corruption issues with previous software version 1.09, typically spurious DCS settings unexpectedly appearing on a few memory channels in the radio. I wound the transfer baud rate right down to 1200 but that didn't seem to help.
I was hoping that by reading the data back from the radio, I could edit any incorrect data on the PC, then reset the radio and squirt the "fixed" settings back in. Yet somehow the corruption seemed to get invisibly transferred back into the PC software data file. The only way to fix it appeared to be to entirely re-enter the offending tone settings from the PC, save and transfer back to the radio.
I actually suspect that various cutting and pasting operations I did within the 1.09 software might have been responsible for corrupting the data in the first place, rather than the radio or serial transfer itself.
I await with interest to see how software 1.10 performs!

3605. Help requested with setup of UV-3R

Yahoo group: UV-3R (2011)
Date: 2011-12-07 01:43:33 UTC
From: invrad
Topic: 3605 Message: 3605

Hi all,

Sorry to sound like an idiot newbie, but I need some help with this radio.

I was initially licensed about a decade ago, and at the time I had a Standard C508A HT which I operated with no problem. Then I kind of got out of the whole amateur radio area and sold the HT.

Now, I've decided to get back into it and even upgrade my Tech license sometime in 2012. To that end, I purchased the UV-3R and, while it seems to be a great little radio, I'm having a problem with getting it to work properly. I have forgotten almost all of the programming procedures from using the Standard, and the UV-3R's manual leaves a *lot* to be desired in explaining the procedures.

In other words, the manual explains *how* to change the settings, but I need to find out *why* the settings do or don't need to be changed, and changed to what.

And yes, I've downloaded and read the FAQ but it didn't help much.

My questions involve the following menu items:

1. Rxcode -- what exactly is this setting for? Do I even need to set it to something? How do I know what to set it *to*?

2. Txcode -- same question as #1 above.

9. Step: what determines to what this is supposed to be set?

10. Offset: what determines to what this is supposed to be set?

16. Scanm: what's the operational difference between the two settings?

Everything else is pretty self-explanatory, but I've tried different combinations of the above items and it just isn't working (i.e., I can't kick any of the local repeaters, can't get any responses even on simplex, etc.)

I would REALLY appreciate some input on this! :-)

Thanks......

Rick

Set the squelch for that freq to 5. Check that your offset is correct
and that your freq is dead-on. Good luck!

I'll give it a go Rick, although you will probably get a flood of other responses.

1. If the repeater or other radio you are wanting to receive has a CTCSS tone set on it's transmissions, you will need to enter that code as your RXcode in order to be able to receive it.

2. The same rationale as 1 but this time for your transmitter. The most common use of TXcode is to open the repeater you are trying to key up.

3.Step is the channel spacing, e.g. 25KHz

4. Offset is the difference between a repeater's transmit and receive frequencies, typically 600KHz on 2 meters but either as a negative or positive offset. E.g. my local repeater here in VK7 receives on 146.400 MHz but transmits on 147.000 MHz, that is, it has a 600KHz minus offset. The repeater you are trying to use determines the offset.

5. Scanm - dont know, dont use it myself. I seem to remember though that it did figure in the FAQ?

...the instructions are in Chinese, on paper (none seem to be available PDF for translate.google). Based on the one diagram for a totally different antenna, I'm probably going to totally mis-interpret all the !WARNINGS! and cautions please to not use for heat of daily soup.

Emailed reply from 409 was rapid, but just the published specs, not translated multi-page instructions. I prefer reading instructions when I can.

This fascinating antenna, which will not survive contact with a 75mph lowflying bird or large grasshopper, is made in Taiwan but sold in Hong Kong; and I just couldn't help myself when I saw it in the digital window. I wandered inside and bought one, you know, hoping the shoe would fit?

G-JS144SM antenna is mag-mount. The base is about 2" wide, plastic, and felt-bottomed. Apparently they stuff supermagnets in that dinky mount. It looks sorta like a CB antenna for the roof of a kid's toy 18wheeler.

Nice SMA connector, 11 feet of RG174AU, and otherwise well-constructed, but I have not tried it yet so cannot comment on performance.

What do you think, may I should just mount it on top of the Fridge, or should I go for it down the highway? Well, after seeing Dr. MFJ for a digital SWA checkup first, of course.

Hugs,
Della

(RXCODE) ACTUALLY, this isn't quite true... No RX code is needed in order to receive any transmitted signal. RX code is there so if you can hear 2 or more repeaters on the same channel (or miscellaneous interference) and those repeaters have unique transmit tones then a person can selectively choose to hear just one of or all of the repeaters depending on how RX code is set.

A couple of our local repeaters have an output tone on the transmit signal simply because there is a lot of low level RF/electrical noises in town and it helps keep the radio quiet for those that live near the noise sources until a valid transmission is sent.... I live in the boonies and don't have RX code set for these same repeaters.

PS it is best to not have any RX code set for simplex frequencies (but can be done and might block something you may want to hear).

>
> 2. The same rationale as 1 but this time for your transmitter. The most
> common use of TXcode is to open the repeater you are trying to key up.

(TXCODE) Necessary for almost all repeater access, whether or not there are 2 or more in close proximity. As it is here, this is a necessity since the repeater site is an RF rich environment and the input tone is needed to keep false keying to a minimum.... In situations like this the TR and RX tones should be different, that's why the UV has 2 settings for tone.

>
> 3.Step is the channel spacing, e.g. 25KHz

This affects how big of a step the UV takes when using the VFO knob.
Sometimes this is an annoyance if set to the minimum step size and you want to VFO quite a distance. Also note that by hitting the "F" button to ON during VFO operation that the step size is set to 1MHZ (saves a lot of knob cranking). Push the "F" button again to go back to the selected smaller step size.

While the UV-3R(XX) is relativity easy to manually program, using a PC and programming cable can take a lot of the pain away if you want to program a large number of channels and not manually have to go through the setup buttons for each frequency entered.

From: dellaaxim
Topic: 3610 Message: 3615

Oh, absolutely! There are several repeaters I'm allowed to play on that are "rather distant" for the UV3R stubby antenna. MK2 comes with a multi-band duckie which I'll probably screw on as the top of a home-made Discone. Those parts are still coming in. I also have customed SlimJims and tuned cables, everything in SMA, for "distance" work.

Anyway, the repeaters are 140.xxx and 435.xxx which ought to be a good test of the JS144SM from the home fridge when comparing antennas to apples.

However, I might get picket-fencing going down the highway. I'm betting the JS144SM will oscillate in a large oval pattern unless I also install a fwd knife-edge, which will, of course, make the vehicle look like a shark.

I really want to take UV3R on the road instead of FT817ND. I figure $20 delivered was worth the risk for this antenna. Hmmmm, going through my receipts, I find that accessorizing UV3R is more expensive than keeping up with Barbie Dolls. But it is more fun!

Hugs,
Della

3616. 2nd harmonic looking better

Yahoo group: UV-3R (2011)
Date: 2011-12-08 04:32:00 UTC
From: Al
Topic: 3616 Message: 3616

Just received my UV-3R from Hong Kong. I tested it with our clubs spectrum analyzer and measured the 2nd harmonis at about 37 Db below the fundemental.

I also put my Kenwood D72A on the analyzer, with the harmonic below the noise, which was about 50 Db down.

Al w3ce

3617. Re: 2nd harmonic looking better

Yahoo group: UV-3R (2011)
Date: 2011-12-08 15:04:15 UTC
From: satellitboy
Topic: 3616 Message: 3617

Hello Al,

This is matching the measurement results which I have collected from three new MK2 models: the 2nd harmonic suppression on VHF has been IMPROVED!

The serial numbers of the tested models are: 3110721402, 3110723148 and 3110723134.
All three units have been purchased at the 409 shop (camouflage colored model).

I also have measured values of approx. -38 dBc in HIGH and LOW power settings at all frequencies between 144 and 146 MHz.
The 2nd harmonics are at its worst at 136 MHz (-35 dBc) and almost invisible at 173 MHz.
Of course, it is still not perfect, but the improvement is definitely present!

In addition, the output power in LOW power setting is approx. 700 mW on all VHF frequencies between 136 and 173 MHz which is also a welcome improvement!
The power in LOW power setting is much lower in the older models and very depending of the frequency. For instance I have measured 60 mW at 145 MHz on some older models!

I also have noticed a 'quirk' on UHF in one of the handhelds (serial number 3110721402): the power level in LOW is approx. 200 mW ABOVE frequencies of exactly 430.000 MHz, and approx. 800 mW BELOW 430.000 MHz!! The harmonic suppression is fortunately not affected: it is approx. -55 dBc at its worst (both in LOW and HIGH power setting).
I did not notice this behavior this in the 2 other models, so I assume that one of the new handhelds has a (minor) fault.

So it looks like the new Mk2 models have, indeed, been modified by making some modifications in the VHF output stage (a.o. bias?) to obtain lower 2nd harmonics, also at the low power settings.
I could not find any differences in the filter section (no added or deleted components or layout changes) between the older and new models.
However, I cannot verify that the inductance/capacitance of some components have been changed (not visible for my eyes).

Unfortunately the audio level modification has not been taken care of in all the 3 units, so I had to change the famous resistor in the audio circuit similar to the method used in the older models.

73's, Tom PA2TSL
Almere

The Netherlands

P.S: quite some threads exist with the same subject "harmonics", and a few other UV-3R Mk2 owner has noticed the improvement!

3618. Power on with supply

Yahoo group: UV-3R (2011)
Date: 2011-12-08 15:20:33 UTC
From: danielcussen
Topic: 3618 Message: 3618

Quick question. Does the radio turn on straight away when power is applied, or does a button need to be pressed after the power is applied?

If it was on, before the battery is removed, will it turn back on again if the battery is re-inserted?

The reason for the question is I am considering buying on of these but I would like it to power on straight away after a power failure. Many modern handhelds need a button pressed, unlike older handhelds.

Dan EI9FHB

3620. Se puede ampliar el rango de frecuencia en uhf?

Topic: 3619 Message: 3620

Estimados, eh visto que en otro handys como los de wouxun se puede ampliar el rango de frecuencias tanto en vhf o en uhf.

Particularmente necesito que llegue a 346 en u.

Desde el soft que viene es imposible. Por ahí hay otro soft o se puede realizar alguna modificación por hard.

Saludos y Exitos

Topic: 3618 Message: 3621

Hi Daniel. It reacts in two ways. If you put the battery in, after being taken out when the unit was on, the unit switches on, to the frequency you were on when you removed the battery..

If have the charger/mains unit connected and switch it on at the mains, the unit starts charging and does not switch on.

This is with a Mk.I, and presume the same with a Mk.II although perhaps someone with one could confirm these behaviours or not.

Regards, David G4TUP.

Translation for the above:

You can expand the UHF frequency range?
*
Dear, eh seen elsewhere such as WOUXUN handys can extend the frequency range in both vhf or uhf.

Particularly need to reach 346 in u.

Since the software that comes is impossible. For there is no other software or you can make any changes to hard.*

The op. is from Argentina.

Perhaps someone from the software dept. could answer as I've never used it, and post in both English and Spanish? (I used Google Translate - http://translate.google.com/)

For our friend, I now reply in Spanish :

He traducido la cuestión del Español al Inglés y pidió que alguien que sabe que nos da la respuesta. No sé la respuesta a esta pregunta, pero estoy seguro de que alguien lo haga. Dirán en español.

Un saludo, David G4TUP.

Thanks to all for the responses, I'm a lot closer to getting this HT to work properly now.

My radio does not work under 87MHz.
Can you store frequencies under 87MHz?
How do you do?

Looks like manually it only goes to 87Mhz. You might need the programming cable and software. NR7J

From: noskosteve
Topic: 3616 Message: 3626

That is only 5 dB better than the ARRL number - which is similar to others I've seen, so I wouldn't consider this fixed in any way. It's well within the variation seen so far in the field.

The requirement of -16 dBm which translates to -49 dBc, so it still has a l o n g way to go (17 dB). The carrier is 2W or +33 dBm. 33-(-16) = (a difference of) 49 dB. More like what you saw on your Kenwood.

P.S. it is dB. The "B" is for good Alex G. Bell's name and is capitalized. A "Bell" is a ratio of 10 times power which also happens to be 10 dB. The "deci" for one tenth (of a Bell).

Hi Guys

I tried that only it does not work, so it sticks to the spec.

Also I was also unable to programme VHF broadcast via the s/w, I had to do it manually.

I'm suspecting that these differences in the functionality regarding the broadcast FM may depend on whether the radio is the original or a Mark 2.
I have a UV-3R Mark 2 so maybe that's why the FM memory programming is working for me.

From: stevebirch01
Topic: 3590 Message: 3630

Mike,

Just to check, at risk of stating the obvious, you do realise that the FM memory programming in the software is under a separate menu, "Program" then "FM Freq" ?

On my UV-X4 software, there is a drop-down menu for the FM presets and they all default to 65MHz.
- I set up my favourite stations into that menu,
- Completely RESET the radio
- Told the software to write to radio
and now all the FM memory presets are loaded as per the software.

I find that when I reset the radio, the FM "VFO" and all presets go to 65MHz, which is why I said it was a pain to wind the dial all the way back up to our broadcast frequencies.

I wouldn't have thought that your particular version of Windows should have any effect.

Do let me know in more detail exactly what you are seeing on your setup.

- Steve

3631. FM radio reception

Yahoo group: UV-3R (2011)
Date: 2011-12-09 17:13:40 UTC
From: spokes
Topic: 3631 Message: 3631

I have the Mark 2 version of the UV-3R and have found the topics very helpful. However, I noticed that on the FM reception side of the radio, that there are a couple of local FM stations that I cannot receive. The S meter shows full signal strength but there is no audio. Moving a bit up in frequency I can hear the audio but not clearly. Has anyone else noticed this or is it just a local issue here

Thanks
AC8JW

Is the FM BC very local ?

It may be that since the receiver is an SDR it may be overloaded,
resulting in silence and could explain why you can hear something when
you tune off.

Just a thought.

Good point, but there are other local stations that do not exhibit this behavior. Am wondering if frequency on the display is just not the frequency I am acutally tuned to... Hmm.

thanks

I live in an area with plenty of FM stations but none are immensely strong.
I noticed that the radio had a lot of trouble with one station on 96.1MHz even though that should be a good signal, it just came in distorted. It's slightly better if I offset the tuning to 96.2MHz.
I observed that many stations take a moment for the audio to become clear and the S-meter to read fully. I wondered if this was related to built-in AFC.
I would have understood problems with stations on 91MHz and 104MHz as these would be harmonics of the oscillator for the other SDR chip and a spurious signal would not be unreasonable.
What frequency does the microcontroller clock at? I wonder if harmonics of that clock are causing the problems with FM reception?

That's just about in line with the UV-3R MkII I got, I measured the 2nd harmonic at -34dB.

After my mod (slightly different to others mentioned in here) it was down to -51dB.

To add to this, I see that the microcontroller has a 4MHz clock, so I would also not be surprised to see interference from that on 92, 100, and 108MHz (odd harmonics) and possibly lesser ones at 96 and 104 MHz (even harmonics)

Maybe you could do an experiment and take the antenna off to see if it helps. If that doesn't help, maybe put it in the microwave and slowly shut the door. The shielding may attenuate the signal enough to prove overload of the receiver. Obviously, don't turn the microwave on unless the radio really disappoints you and you wan to put it out if it's misery.

Thanks Joe, I really should have thought of that, Duh!
So, with no antenna, I see a small spurious on 96MHz (that explains my reception issue nicely) and 108MHz, with really strong one at 104MHz (that explains John's reception issue).
Notice that at 104MHz it gets hammered with spurious from two different sources. They probably beat together nicely.

I'm not sufficiently concerned to submit it to the fully functional microwave yet though. This has been one of the best value toys I've had for a long time. Some of my local stores charge more for just a NC60 battery alone. The Hong Kong seller even thoughtfully labelled the package as "Toy".

OK Steve,

Although it appears to be a crappy little radio, I have to agree that
the entertainment factor has been worth more that the $40 I paid. The
Wouxun I also have seems to be a better radio, but at over double the price.

Yes, I'm keeping mine and no regrets buying it. It's been fun and only
cost the equivalent of several visits to Starbucks.

3642. Re: UV-4X V1.10 Software

Yahoo group: UV-3R (2011)
Date: 2011-12-10 15:37:04 UTC
From: Mike Bowthorpe
Topic: 3590 Message: 3642

Hi Steve

OK on the broadcast drop down menu.

I tried the reset as the MKII manual (which of course does not work),
then used........

Factory Reset for UV-3 R version with 18 menu is:
Radio turned OFF then:
press [U/V]+ [ON/OFF] till radio turn ON

Which worked fine.

I think the issue was...........

1. I needed to reset
2. I may have used a previous saved older version of the file i.e. .3R
file which may have contributed to the problem. The moral I suppose it
always save a virgin file; then modify, save and use that.

Thanks for the help :-)

Not sure, but I think the easiest way to tell the diference is the display.

On a mark II you have a dual display, i.e., have two lines of
letters/numbers, instead of a single line available on uv3r 'mark I'.

Mark 2 display - http://www.radiogearpro.com/picture/uv-3r-mark-ii.jpg

'mark 1' display -
http://images.quebarato.com.br/T440x/radio+ht+baofeng+uv+3r+dualband+vhf+uhf+ultra+compacto+2+watts+vox+e+mais+sumare+sp+brasil__70CE36_4.jpg

Please someone correct this if I am wrong.

more importantly, does your UV3R have 12 or 18 menu settings? (last in the early series has 18, although AFAIK models with on 12 menu items can still be programmed to change the other six via software)

still waiting for my programming cable... already have the software (CHIRP) running under OS X 10.5.8

3646. Problem with this radio

Yahoo group: UV-3R (2011)
Date: 2011-12-12 15:25:15 UTC
From: Kelvin Smith
Topic: 3646 Message: 3646

Ok just got this mini UV-R3 Mark 11 version radio and the output on vhf is very low, reading around 50mw low power and just under 100mw on high power, right across the vhf band the output power is very low.
UHF is fine and is reading around 1.9-2.0 watts into a suitable UHF swr meter with correct dummy load, have checked it on 2 different meters and get the same results.
Have searched the internet and all i have found is people with a problem with it on low power Vhf, eg the power varies wildly... and is to low..
My problem is, the power is very low even on high power and cannot hit a repeater 2 miles away line of sight "almost" whilst stood in my back garden.
UHF is fine and can heat a repeater 5 miles away even on low power.
Anyone else have this problem and is there a fix "i doubt it" P.S i do not have a programming cable

3647. Re: [UV-3R] Problem with this radio

Hi Kelvin. Well if you've checked it with two different meters, and those meters do cover 2m, and also the dummy load is good at 2m too, it does rather sound like the rig is faulty I'm afraid. There's only the low/hi power menu item, nothing else that could affect the output, especially as the UHF side is OK, so the battery must be good....

I presume you've used the meters with other 2m equipment and the power shows correctly? If not tried with other 2m equipment on those meters I wonder, as a last ditched attempt, if it's worth trying on another local ham's equipment?

Best of luck, David G4TUP.

Please remember that Chirp only changes the freq, or tx/rx items. You will still need the UV3R software for more basic setup programming -- then go to Chirp for the memory channel stuff --

A compromisive resolution of Sorts.

(Thanks for enduring the whining). Here is what I learned:

It was possible to enter some information on the VHF bank and then transpose it up to the UHF bank and enter it into memory. After that I amended the p'rams and entered the freq into the upper memory bank.

As I will never be using all 99 mems, I've settled for the aptest machines that I can reasonably hit with 2-watts or less from here in the City of San Francisco. Essentially I have memory bank of scanable frequencies with which I can communicate that include both UHF and VHF freqs-- It was not my dream of the radio, but it works enough for what I had intended.

I am disappointed with the ill luck of the draw in coming up with a defective machine; fortunately it did not consume my lunch money, but for a half a radio I could have have pulled four more drafts of Guinness!

Hi, thanks for the reply David, my equipment is fine and i have checked other 2 meter gear on the same equipment, i would guess the rig is faulty, i will check current drain later and see how much it is pulling during transmit and see what results i get...

It certainly is a strange one as it appears to receive fine on 2 meters but the output is very low, but like i mentioned, the uhf output is fine.

Kevin, if you're happy with opening up the rig it might be worth doing that and just seeing if there is a solder blob across tracks, or a badly soldered component that is not making contact with the PCB. Magnifying glass recommended! Paulo IK1ZYW had a problem with a cold solder joint with the switching diodes (see the FAQ for more details). There are also details in the FAQ of how to open the rig and disassemble it too - look for*** How to disassemble UV-3R**.

There are two PAs in the rig, one for UHF and one for VHF. Both have a separate bias supply from the main chip. It sounds like the VHF PA is either not getting the correct bias, or the PA transistor is not getting volts to it from the battery, or the soldering is amiss, or a component failure.
**
*Good luck! .d. G4TUP.

Hey tenorman1952.
Happy Holidays :-)
Try going to "Messages" on our users group page and search for "Antenna". That should give you more than enough returns. There are so many opinions on what to use. It would be best for you just to read and chose for yourself from all the posts. I myself am using a Nagoya NA-701 and love it.

Last sunday I had to use the uv3r with the speaker mic, but when I tested the coms with my friends radio, the Baofeng locked on transmit. I tried moving the plug in and out, turning it, etc, but it would still lock and so I just could not use it then. this was very frustrating...

"I have read about the lock-on-xmit problem. There seems to be several work-arounds.
>Hugs,
>Della"

can you point out some of these work-arounds for the speaker-mic "lock on transmit" problem, please? I tried searching the group but could not find it. Thanks in advance.
Nuno

Same problem Dec 3 with the Santa Claus Parade. My work around was to listen with ear phone on UV-3R and turn volume down on Wouxum and transmit from it.

Yes, it appears it can be done. Here are some instructions, haven't tried it myself:
http://groups.yahoo.com/group/UV-3R/message/3467

And here is a video of someone's unlocked UV-3R, might try messaging him for instructions:

3666. Re: [UV-3R] new MK II comes with USB charger

Yahoo group: UV-3R (2011)
Date: 2011-12-14 11:27:06 UTC
From: DavidN
Topic: 3655 Message: 3666

Thanks pstan for mentioning this. But just a word of warning to those who don't know the full story on USB chargers - they're not all created equal. So sometimes it's quite tempting if the original charger cannot be found to use another USB charger.

Now.... I presume that the new USB charger supplied with the Mk.II is 1000mA, however, some USB chargers are only 500mA and the USB output of a PC/laptop is usually limited to 500mA, meaning for charging it'll take at least twice as long. Also, if you try to use the rig on transmit with these 500mA devices there may be some damage to them, depending on how robust they are.....

Regards, .d. G4TUP.

Hi Lee. No this is not necessarily so as Paolo and I keep it up to date. If I see something of interest it's usually in there within 24hrs. However, the FAQ is not published every time a new item is added, it may be two weeks or so before there's a sufficient amount of new items for Paolo to publish.

However, one side of the rig I do not publish is the programming side as I do not use a cable. To keep this facet up to date, if someone with experience is willing to help with the programming side of the FAQ please take one step forward. :)

Regards, .d.

My no-name speaker mic works fine, but the supplied earphone-mic needed the ferrite core fix with 2 turns. My conclusion from that is that your speaker mic is not as good as mine. If I were you, I would try another speaker mic.

I noticed I got the cutting out when I used the dual band antenna but when I connect an external antenna like the micro mag mount Airlink antenna it doesn't have the same effect. It seems to keep the signal so yeah must be antenna and intermod related.

Chris KF8ZR

--- In UV-3R@yahoogroups.com, "The Simpsons" <grant@...> wrote:
>
> It could be something like that. Being an SDR receiver there could be some strange effects especially with off frequency signals. Thje squelch is a bit strange to what we are used to with the usual analogue devices we have used for years. Have a listen to the audio when the squelch opens at very low signal levels. The frequency response of the audio seems to be limited, especially at the high frequency audio. Once there is speech on the signal, it sounds normal. The radio does respond differently to a data signal as well, such as the data stream on a trunked system control channel. I assume the demodulation of the FM signal is also done under software in the receiver IC so this could explain the unusual effects.
> What it does show that I think Darvell is heading in the wrong direction by assuming his problem is due to too strong a signal and looking for a different antenna. If high signal strength is the problem, simply unscrewing the antenna so that it doesn't make contact with the centre pin but still sits on the radio will cause a large loss of signal but there should be enough leakage to still receive the signal. I would like to see the results of this simple test.
> I don't use mine for monitoring over a long period of time but under normal communicating use I've had no problems.

>
>
> I would not expect changing the antenna will correct this problem so to prove it I finally got around to connecting my UV-3R to my HP8920A test set. As expected, the signal strength had no effect on the radio until it was low enough for normal squelch operation. I took the level up to □20dBm with no problems at all. This is what I would expect on any FM receiver. I also tried over deviating the signal and that also did not cause the squelch to close at high signal levels compared to lower levels such as □100dBm. With the frequency set 5KHz off requency, again the signal level had no effect on the squelch operation.
> The only way I could simulate what Darvell is experiencing was to set the radio to the narrow setting. The squelch then would close at over 4KHz deviation but this was not affected by signal strength, only the actual deviation.
> There is no way you will find an antenna that has a good SWR on transmit and high attenuation on receive as such a thing cannot exist! There is a way though and that is to use an attenuator in the connection between the antenna and radio. This will not fix the problem as others have also said in their replies to this thread. This is not a signal level problem!!
> Darvell, have you confirmed the radio is not set to the narrow setting? This is the only way I can replicate the problem.

I have a MkII which exhibits exactly the same problems:

- RXCODE and TXCODE cannot be adjusted on VHF using the rotary knob
- Random MHz digits appearing in front of the offset frequency

It appears that firmware has gone into production without being tested.

Paul :
I was curious to know whether your UV-3R was delivered with this problem, or whether it became faulty while you had it.
Neither of my two Mark 2 radios seem to show the problem - but I'm worried now whether it might appear later!

>
> I checked my UV-3R on my trusty service monitor (Schlumberger 4031) that has a feature specifically for measuring harmonics - and has been verified correct with other gear (e.g. HP analyzers, etc.) and here is what I found:
>
> On 70cm, the 2nd harmonics were at least -60dBc at 420 MHz and better at 450 MHz.
>
> On VHF, however, the story was different.
>
> At 162 MHz, the 2nd harmonic was -65dBc, but just -32dBc at 144 MHz: Higher-order harmonics were adequately attenuated (better than 65 dB down from the carrier) at both frequencies.
>
> Clearly, the folks that built the radio were serious when they specified the 136-174 MHz frequency range, but weren't quite serious enough to add an extra couple of poles to the VHF lowpass filter to to provide an adequate cutoff: In other words, the LPF had to be designed to avoid knocking the carrier down at 174 MHz with its 2nd harmonic at 348 MHz, but it has not quite enough poles to do the job at the 2nd harmonic of 144 MHz (e.g. 288 MHz) *and* still pass 174 MHz.
>
> Careful inspection will reveal that the RF PA stage of the UV-3R is pretty simple: A couple of chokes/caps to form a broadband impedance transformation to 50 ohms, perhaps 3 caps and 2 chokes for an LPF, and then another choke/cap for the VHF/UHF diplexer.
>
> Inspection also revealed a place for an uninstalled surface-mount chip cap, so this got me to experimenting.
>
> Noting that the "missing" cap went from between the RF output and ground on the output of one of the coils (the other cap appearing to be in series - perhaps a blocking cap?) Going by my gut feeling (and also checking my 50 ohm filter tables) I decided that something in the 33-47 range would be OK.
>
> Not having any 0400-series chip caps handy, I just used some small disk-ceramics and wedged it in. A 33pF improved the 144 MHz 2nd harmonic rejection (e.g. 288 MHz) from -32 to around -42dBc and actually bumped the power up from 1.65 watts to 1.95 watts.
>
> Swapping it out to a 47pF unit resulted in the original 1.65 watts, but the 2nd harmonic (288 MHz) was now at -48dBc. At 162 MHz, the output power was down to about 0.6 watts, but I wasn't planning to transmit there, anyway!
>
> Not seeing any other obvious places into which I could cram another disk ceramic, I stopped there, but if I were to be fanatic about it, I might have added some inductance to

some of the coils.
>
> While not quite the "better than -60dBc" that my other HT's do, the fact that a typical antenna would be nonresonant at the 2nd harmonic, I feel reasonably confident that the radiated harmonics would be quite a ways down - more along the lines of a 70 watt mobile rig with a -60dBc 2nd harmonic...

3681. re battery charger unit

Yahoo group: UV-3R (2011)
Date: 2011-12-15 10:26:32 UTC
From: R O
Topic: 3681 Message: 3681

Has anyone had problems charging their battery? The charger worked the 1st time and won't work for the 2nd re charge. Tried serveral other powerpoints in the house and charger does not light up. Any suggestions anyone? Only managed to charge the battery once.

Still having programming issues. Read my earlier post. Reset the radio back to default and still no good.

Topic: 3683 Message: 3683

Hi Bart! Well have a look at the present FAQ in progress and see if there's anything that's been missed or can be added. The URL is:

<
https://docs.google.com/document/d/1-6qmDIGSLrh6mhhAVpjTrJYO4loQzxQq8fv4AGp9SI0/edit?hl=en_US
>

The file auto-saves when you make a change. Really Paolo is the head honcho of the FAQ, but would anyone like to help Bart on the programming side of the FAQ?

.d. G4TUP.

On Wed, Dec 14, 2011 at 5:42 PM, <bartvanallen@...> wrote:
"However, one side of the rig I do not publish is the programming side as I do not use a cable. To keep this facet up to date, if someone with experience is willing to help with the programming side of the FAQ please take one step forward. :)"

I'm not sure how much help I can be, and would not like to have the responsibility of being alone in the task; I am willing to work with you on the programming components of the FAQ.

Perhaps we can call this a half step forward? Am I "hired"?

From: Paolo Cravero
Topic: 3683 Message: 3684

Hello all.
Few minutes ago I was doing the periodical review of the
work-in-progress FAQ document and found improper language in it.
Therefore I have restricted anonymous access to "comment" instead of
"edit", regardless if it was directed to me or to careless (new)
members asking what has been documented long ago.

I do welcome Bart to help on expanding the programming subjects (but
not only that!).

I am building my own programming cable too, so I will be glad to
follow programming suggestions documented through the FAQ.

From: Mike Bowthorpe
Topic: 3155 Message: 3685

Hi All

One of the first 18 menu UV3Rs I bought had RF feedback using a cheapo mic.

However when I used the same mic on a MKII it worked fine, so my guess
is the issue was recognised and the radio was modified by the manufacturer

This may explain why we are getting varying results with different radios

From: Wayne
Topic: 3692 Message: 3692

I just got my radio. It's a MarkII. Someone must have been listening because the volume control will take the radio from a wisper to a shoot. The supplied headset will still hang the radio in transmit if I don't make a couple of loops in the cable. Otherwise the radio works as advertised. (Haven't checked the harmonics.)

3694. hand mic with volumn control

Yahoo group: UV-3R (2011)
Date: 2011-12-16 01:24:12 UTC
From: bartvanallen@gmail.com
Topic: 3694 Message: 3694

Has anyone that also has or had a Yaesu vx3r or similar compared the speaker/mic jack pin-outs to see which wires in the mic need to be swapped to make it compatible with the MkII UV3R? That would open an easy way to have a speaker/mic with volume control and there are many inexpensive no-name or off-brand ones available.

From: pstan82
Topic: 3523 Message: 3696

after done my setting from 118-390 mhz, and 391-520 mhz, here my conclusion:

with checking on my frequency counter, only 131-250mhz scanned on counter. althought i set the frequency to 124.600, counter only detect 131.6500. as on U band, only can detect 400mhz above till 520mhz.

dont have another MARK II, otherwise will try to transmit both at 118 mhz and try.

--- In UV-3R@yahoogroups.com, bartvanallen@... wrote:
>
> Agreed for the most part.
> I DO receive the local 220 repeaters, great audio too. Sorry I don't have video for this. But -- although the red LED lights up on TX, listening to a scanner set on the same freq (using simplex for the test) shows there is no RF output. So it DOES receive way out of bounds (at least on the 1.25 meter band) but it does not transmit. I assume the main processor programming could be changed somehow, but that would also indicate a new filter/rf amp would be required as well for those freqs.
> Oh well, I would get the Wouxun if that really mattered much ---

From: Mike & Kathy Lindsay
Topic: 3155 Message: 3697

The problem with the earphone cable latch-up on VOX is RF getting into the mic, not anything wrong with the vox circuit. Going to low power reduces the RF, so reduces the RF into the mic.

Get a copy of CHIRP

http://chirp.danplanet.com/projects/chirp/wiki/Download

You need to add the PPA, instructions here

https://launchpad.net/~ubuntu-hams-updates/+archive/ppa

You dont need any special drivers for the cable, it's built in to Ubuntu.

if you get stuck just ask.

It works as well if not better than the supplied software.

With the Pl tone set and frequency set, you also have to look at the offset for the repeater. The repeater will normally be some 600 kc above or below the setting you see on the radio.

The Santa Rosa one is what I'm trying to connect to. I have my radio now set to 444.750
Txtone is 100
Offset is 5.000
And shift is +

Does that should correct?

From: Nuno Xavier
Topic: 3699 Message: 3711

just my 2 cents:

Search the web for files with your local repeater settings and upload them to your radio. Maybe this is easier. Or compare them to what you are programming.

On the files sections there are .DAT files (the ones uv3r uses) with , for example, Portugal repeaters, spanish repeaters, or marine vhf frequencies, ready to upload to your radio.

Maybe you can find your local repeater settings somewhere on the web, ready to upload.

I hope this helps, as I
Nuno

3715. Re: Trouble reaching local repeaters

Yahoo group: UV-3R (2011)
Date: 2011-12-16 22:52:39 UTC
From: ckuhner@att.net
Topic: 3699 Message: 3715

Been listening to it for a week but only tried to tx today. Not hearing a repeater tone when I key up though.

Funny,

I am using UV-X4 version 1.10 and no good. I get a "Mistake Model" error box then everthing is set to 0. I tried renaming the file to a .3R but no good either

just my 2 cents:

Search the web for files with your local repeater settings and upload them to your radio. Maybe this is easier. Or compare them to what you are programming.

On the files sections there are .DAT files (the ones uv3r uses) with , for example, Portugal repeaters, spanish repeaters, or marine vhf frequencies, ready to upload to your radio.

Maybe you can find your local repeater settings somewhere on the web, ready to upload.

I hope this helps, as I
Nuno

2011/12/16 ckuhner@... <ckuhner@...>

That's what I'm trying to figure out but wanted to see if I could verify my settings are correct. If they are then my guess is I'm too far away.

George,

Thanks so much for the info! I thought I might be out of range but was not sure so I wanted to double check my settings. Everyone was so helpful which is awesome! Well, I guess I'll just have to wait till I get my mobile rig going once it gets here and try to access the WIN on it.

Thanks so much again!

3721. No TX/RX open Squelch

Yahoo group: UV-3R (2011)
Date: 2011-12-17 02:52:09 UTC
From: ka1cvv2000
Topic: 3721 Message: 3721

My first Gen UV-3R has a problem. The squelch is stuck open and the PTT will not Transmit! I tried Full reset via holding UV key and turning on Radio that did clear the memories but did not fix the Radio! Next was to removed battery and put different one in. Still did not fix the problem. If anyone has found a fix please Post it for us! TNX 73 de KA1CVv in Connecticut USA

Try turning BCLO off (in normal menu system)
And then re-adjust squelch setting to 1.

EXPLANATION

BCLO = busy channel lock out.
It stops you from tx'ing if there's a signal being received.
If squelch is off then it thinks frequency is busy and the BCLO
comes into effect.

Andy

George,

Do you think a different antenna would help or is it that the unit just lacks the power to make it that far?

3725. Re: Trouble reaching local repeaters

Yahoo group: UV-3R (2011)
Date: 2011-12-17 15:52:14 UTC
From: Bart KA7ZFD
Topic: 3699 Message: 3725

If you have saved UV-3R programming files with the DAT extension, that means you have an older Mk I radio (the newer ones use the .3R extension). You will need the older program to read it. The Mk II radios have a slightly different file format, so the data file will not load correctly.
What program version were they originally saved from? That would be the correct program to start with, and perhaps a newer version may work, but not the last three or four versions.
In Chirp, the saved basic programming setup will be saved along with the channel info, so the older saved files will have data that matches the Mk I format.
If you are trying to program a newer radio, the files saved in Chirp or UV-3R programs will not work. You can copy/paste the channel info in Chirp to a file saved from the older to the newer radio formats to keep from re-programming all of them.

Unfortunately Wine won't help in this case, as it has no or at least very little support for USB.

But you can map ttyusb0 or whatever to a COM port and then the Windows programs under Wine can access it. I don't use Linux but I have done and have run some ham software under Wine. I seem to recall it involved editing the "registry".

From: Derek Haden
Topic: 3698 Message: 3728

indeed you can, however why struggle make all that extra work to fudge a windows program to run in this fashion, when there is a perfectly good Linux option?

The Baofeng software is nothing special, and does no more or less than Chirp.

3729. Re: [UV-3R] No TX/RX open Squelch

Yahoo group: UV-3R (2011)
Date: 2011-12-17 18:34:01 UTC
From: Dan Morrison
Topic: 3721 Message: 3729

The Army electronics repair technicians told me that some equipment had the "4 foot drop test", That was in the 1990s.

My dad was an Army commo chief in the early 1950s, and I recall him saying that the only organizational maintenance for the SCR-536 "handie talkie" was the drop test.

Dan

"It is not the style of clothes one wears, neither the kind of automobile one drives, nor the amount of money one has in the bank, that counts. These mean nothing. It is simply service that measures success."

3730. UR-3R MORE programming pl tones QUESTIONS

Yahoo group: UV-3R (2011)
Date: 2011-12-17 19:53:26 UTC
From: brasspounder1
Topic: 3730 Message: 3730

Under a previous post of similar title (12 December,I believe)(excluding the CAPS above), it became clear that I got hold of a defective radio-- I didn't shed any tears or blood over it, just self-doubt and sweat.

But this question then came to mind: "Might the USB cable programming succeed where the manual programming failed?"

It does not seem likely-- but has anyone tried this? And if so, to what effect?

I've made peace with the minor dollar loss, no more than springing for a couple of rounds of drinks at the local. Ideas?

3731. New file uploaded to UV-3R

3732. Re: [UV-3R] Re: Trouble reaching local repeaters

Yahoo group: UV-3R (2011)
Date: 2011-12-17 21:12:50 UTC
From: Shaun
Topic: 3699 Message: 3732

Thanks.

I was trying to save the effort of re programing the Marine Dat file but if I can not get it to load into Chirp and if I ran an old verson of the programing software it probably won't program my M2. Better dust off the numeric keypad part of the keyboard I think. :-(

Shaun

3733. Re: software for unbuntu

Yahoo group: UV-3R (2011)
Date: 2011-12-17 22:22:57 UTC
From: Bart KA7ZFD
Topic: 3698 Message: 3733

Your first paragraph is correct Derek, but the second needs some review and explanation.

A comparison of these two programs finds:

Chirp programs each memory independently including - Freq, Tone mode, tone, DTCS code, mode, duplex (+ - duplex shift), offset, wide/narrow fm, power - but does not do the basic set-up programming.

Baofeng software UV-[nn] (where [nn] = 3R or X4) has these although listed differently such as duplex/offset as separate entries for rx/tx freq sets. In addition UV-nn includes setting the basic setup items like Freq Range, scan setups, vco setup for both UHF and VHF vco's (rx freq, tx freq, encode, decode, power, fm wide/narrow, VCO step), squelch, VOX, ToT, channel mode (vco or memory mode), backlite setting, key tone, busy lock, and save function.

These additional options in UV-[nn] are downloaded and saved/uploaded in Chirp, but not independently settable. They must be manually entered each time they need changing. Maybe that can be changed in future versions?

UV-[nn] is far more comprehensive and useful for initial setup whereas Chirp is easier to use (copy and paste!) and far more flexible for general updating those 99 channels.

USB drivers are available for most chipsets used in USB cables for Unix/Linux operating systems.

Part update. Don't quit your day job just yet to go into Taiwanese antenna sales. Maybe later, but too soon to tell right now, unless you just want to monitor traffic.

RX from 100w omni repeater in next state. ~45 miles w/rolling terrain between. Overcast, but otherwise a "normal" TX-RX kind of day. 146.xxx SQ set to 5. Vol on low.
I figured I'd just take all my antennas factory-fresh and try them as out-of-the-box.

Comparisons:
1. Stubby dual-band antenna (Diamond, or so it says on the outside) received, but just barely.
2. Mk2 antenna (dual band) received OK, even inside the Jeep.
3. The Taiwan mag mount brought the signal in clear 59, and I didn't even bother to tune the antenna.

TX? Couldn't break - absolutely not a moment of silence - 4 guys chatting for over 30 minutes while I'm driving to the store. 3 mobile (one QRP on a pedal bike - lots of huffin' n puffin' over the air, and his VOX kept cutting in and out) all going home different directions from some common event, talking all the HAM stuff to a fourth already relaxed in his shack. Then, as if on schedule, they all CL'd! Or maybe they were raptured. It was all rather sudden. I just know that it was my turn, but I was talking to dead air and a digital repeater.

Sorry, no signal reports this time. Rats, and I had the time, the batteries, and the entire miniture antenna farm in my lap.

I've got to chat the guys up at the next meeting - "Say, fellas, when you give out your call signs, how about waiting about 5 seconds for somebody to get a sign in edgewise?" Four call signs like machineguns and then back to ladder lines, batteries, and which corner has Girl Scouts selling cookies.

Oh, well. I don't own the repeater.

But all that chatter had one up side. I had wall-to-wall reception against which I could test RX vs speeds. As predicted, at about 45mph the picketfencing came in; but it wasn't as obnoxious as I expected. Pulled over in dense tree cover (rural, you know?) the magmount antenna definitely is a catcher.

I'm leaving the Taiwan antenna mounted on the Jeep. I still have to compare TX-vs-antennas (hopefully with cooperation of club members also on cell phones). I'll skip the repeater, go for broke, driving slowly away, changing up antennas as I lose signal.

I ran the cord down the right-rear door, closed onto the gasket, using the door I hardly ever open. I admit, the extra coax (which might mess with TX when it's OK for RX) came in handy - I looped it up between the seats and dropped UV-3R into a cup-holder. Maybe I'll suspend UV-3R from the ceiling using a belt-key retractor like the CBrs do? The speaker mic works well for me, but darned if I didn't try to hop out and find myself tethered to this

dinky red radio straining from its mag-mounted antenna, suspended in air over the drink cup.
Ooops.
Hugs,
Della

3739. Re: [UV-3R] Re: software for unbuntu

Yahoo group: UV-3R (2011)
Date: 2011-12-18 16:40:37 UTC
From: Jaap De Goede
Topic: 3698 Message: 3739

Hi,

I'm using XUBUNTU 11.10 with CHIRP installed through Ubuntu Software Center
after executing the instructions over here:

https://launchpad.net/~ubuntu-hams-updates/+archive/ppa

I also use the Baofeng 1.09 software for Windows on top of WINE, the
windows emulator in XUBUNTU.

For the radio I have a USB-programming cable.

For CHIRP I use /dev/ttyUSB0, but WINE does not support USB drivers.The
cable however is being recognized as a serial device and then all you need
is a symbolic link between the com port set in the Windows Baofeng program,
e.g. com1 and /dev/ttyUSB0 and that must be in the folder ~/.wine/dosdevices

This will work:
ln -s /dev/ttyUSB0 ~/.wine/dosdevices/com1

Regards, Jaap

I cannot get a program software to load And run on my HP Mini Laptop in order to Program.
My new Baofeng Radio.
I get a message asking me to download another Program. In order unzip file And that program. Won't work.
Any help appreciated.
Please email solution to CLjericho@....

Thank you. Curtis

I had this issue with a UV-3R, still do. The best I could come up with was to set everything in A's memory and just live with it that way. I somehow can't buy your salesman's position because the UV-3R manual explicitly says otherwise on page 17. Effectively I have rx/tx on VHF and UHF but they are not in discrete banks.

I doubt that this is helpful... I want to buy a couple of more but I sure as heck don't want to endure this frustration again.

Compressed files are used to save disk space and download/upload spectrum. The free program I use to open up various files is called 7-Zip, and will be useful for most compression techniques used these days.
http://www.7zip.me/download/free-7-zip-download-y.php?pk=5998
You may want to have that sitting on your computer for when it is required to open a file

I think the best place to get 7-Zip is from the mother site... http://www.7-zip.org/ . I have this lack of trust with sites that re-distribute GPL software in hopes that you will look at their ads, or worse, have buried something nasty in the program.

Probably just paranoid...

3746. UHF Step-setting bug (the plot thickens...)

Yahoo group: UV-3R (2011)
Date: 2011-12-22 16:14:59 UTC
From: stevebirch01
Topic: 1819 Message: 3746

I have two UV-3R Mark 2 and neither of them seem to exhibit the step setting bug as described in the FAQ. Furthermore, mine also seem to behave differently to each other! Incidentally, I have "factory-reset" both since I have had them (by the U/V+power button method) to clear the memories.

Let me explain how they behave.
In each case, assume I start in UHF VFO mode (not memory mode).
I now have the "-" symbol to the left of the upper line of the display, UHF frequencies, and I could adjust the UHF frequency by turning the dial.

Radio #1 (a cammo colour example)

- I press MENU,
- I turn the dial to get "STEP" on the display,
- I press U/V to move the "-" symbol down to the step size on the lower line of the display,
- I turn the dial to get a different step,
- I press MENU again to exit the setting menu.

Now, when I turn the dial, the VFO adjusts with the new steps that I have just selected.
The selected step size affects both VHF and UHF.
It doesn't matter whether I adjust the steps from VHF or UHF mode, I get the same outcome.

Radio #2 (a black example)

- I press MENU,
- I turn the dial to get "STEP" on the display,
- I press U/V to move the "-" symbol down to the step size on the lower line of the display,
- I turn the dial to get a different step,
- I press MENU again to exit the setting menu.

Now, when I turn the dial, the VFO adjusts in the new steps that I have just selected. But, importantly, the selected step size only affects UHF. If I switch back to VHF, it still has the original step size. I can set the steps for UHF and VHF INDEPENDENTLY.

SO, either I'm completely misunderstanding the bug as described in the FAQ, or there are THREE different functional behaviours possible; the one in the FAQ and the two that I have observed.
Now this is very interesting because it would suggest that either (a) the radio firmware can get corrupted in a way that isn't cleared by factory reset, or (b) there are three different firmware versions out there.
I wonder what else they have changed ??

I'm looking forward to seeing what other people find!

- Steve

Fascinating.
I'm wondering if it would be worth the trouble to compare these differences with serial numbers? Perhaps map out the variances, if they actually coincide with serial numbers? (processor could be programmed prior to insertion?) I don't know, just a thought ---
ps -- mine actually has 19 "menu" items, not 18. Is this the Mk II standard?

From: Curtis
Topic: 3748 Message: 3748

I am using the UV3R 1.07 Software to program my readio and I only see one set to Memory options and wonder how do you get Dual Band capability when setting up banks. I only see the one option to add Freg.s. Any ideas. Otherwise I love the radio.
Thanks.

From: stevebirch01
Topic: 1819 Message: 3751

OK Bart, my "radio 1" (no FAQ bug but common step for VHF & UHF) is s/n 3110413247
and "radio 2" (completely separate VHF & UHF steps) is s/n 3110726072

Both came from 409shop.
(and yes, both have 19 menus, where no. 19 is the priority channel)

- Steve

Great - thanks -
Just for fun I started a database. Don't think the columns are final, it is just what seemed useable on first pass. I added your two and my one radio, so maybe we can get some idea what versions may be out there --
I left it open for anyone in the group to add new records, and the moderator folks to change the database (default values). Hope that is OK with everyone.

Steve - could you please give the serial numbers for these two radios? We will add it to the database for comparisons
Tnx!

Well done Bart - very interesting.
Let's get some more data in there, folks!
It would be especially useful to get some of the serial numbers of the radios which experienced the repeater shift corruption, although I suspect that most will have been returned to seller.

I can already see that someone has a Mk 2 with a serial number near one of mine that shows the same "independent" step behaviour.

Now all we need is a way to update the firmware to the best version ;)

With festive greetings from the UK,
- Steve

Yes, well done Bart. I presume the database is not just for VHF/UHF steps, so have had a quick trawl through recent messages where it was mentioned that later Mk.II versions had a reduced 2nd harmonic problem, and serial numbers were given too. If you want to add these have a look at msg 3617 (which also mentions a quirk in the power levels but not sure I understand that bit...),

http://groups.yahoo.com/group/UV-3R/message/3617

I wonder if it's worth putting in the FAQ that if anyone conducts tests and posts the results the serial number would be handy?

Regards, .d.

"does the same" -- please specify which it is the same as -- I suspect because of the serial number that both UHF and VHF are affected the same rather than independently? Thanks for clarification, and for getting the info in, it is appreciated.

3759. Re: UHF Step-setting bug (the plot thickens...)

Yahoo group: UV-3R (2011)
Date: 2011-12-23 16:40:59 UTC
From: Bart KA7ZFD
Topic: 1819 Message: 3759

Yes sir on both.
Any variations AND requesting serial numbers for any odd, weird, new or not understood behavior. Good idea to put the request in the FAQ, maybe up near the front, in the overview section? I thought adding where or from whom purchased may dicipher any 'distributer special bversions' from standard, if any. (I was thinking along the UV-3R vs UV-X4 thing)
Maybe we can define better, worse or upgraded op-sys programming. May be useful to the manufacturer as well as software designers along with our own curiosity too (Chirp etc).
Please note that Group users can add their own info directly, no need for us to enter it all in. But maybe there should be some ground-rules for keeping it concise and accurate?
Your thoughts are most welcome! I suspect that keeping it sorted by serial number may be most useful for spotting basic trends?
"menu items" useful for when Mk I changed to 18 items, and if/when any other changes occurs in the menu.
"Bugs/delivery probs" useful for tracking bad batches, versions or vendors.
"variations from expected" I thought would show new things or packaging stuff, like the change to USB charging cable, etc
"notes" seems the most useable for ID'ing version shifts -- anyway, these were my original thoughts when I put it together ---
Have fun!

Where's home?

Bill at Fleetwood Digital Products hasn't steered me wrong. I lost one uv-3r and got a red uv-3r, and a Wouxum from him.

No problems at all. Make sure you get programming cable. Makes it easier to program when you have fat fingers

Further to below, if I change the step in UHF it does not change the step, I have to change the step in VHF which applies to both VHF and UHF. Mine is a Mk2 ser No.3110716253

Topic: 1819 Message: 3768

Apologies, on my mk11 while in vfo mode i can only change the freq step by using the lower vfo...step changes on the lower vfo effects both vfo 1 and 2, for example if vfo 1 is displaying 433.250 and i change the step size to 12.5khz the freq will still advance in 25khz steps but if i do same on the lower vfo then the change is accepted and both vfo's advance in accordance with the new step setting..

"does the same" -- please specify which it is the same as -- I suspect because of the serial number that both UHF and VHF are affected the same rather than independently? Thanks for clarification, and for getting the info in, it is appreciated.

just go to ebay and type in baofeng... you'll find the best prices there. Usualy you wait about 2-3 weeks for a delivery from Hong Kong. You can order them with speaker mics, car chargers, USB chargers, padded cases, programming cables, etc...

I've bought two of them off of ebay and both are the 19 menu ones...

3771. RX audio

Yahoo group: UV-3R (2011)
Date: 2011-12-24 09:42:28 UTC
From: m1elr
Topic: 3771 Message: 3771

Hi all,

I have a MKII UV-3R, quite happy with it except for one problem,

When it starts to receive a signal the rx audio for the first half second is quite deep with a good amount of base, it then changes to a more high pitched tone. I have done tests and it appears to be signal strength related.

Anyone else have this problem, is it just the way it works?

Regards

Carl

3772. Re: [UV-3R] RX audio

From: Geoff Booth
Topic: 3771 Message: 3772

Hi,

I have a MKI having purchased shortly after they first became available and it also has the same funny quirk, but that's all it is.
Yes it is signal strength related, along with the RX being activated when the squelch was previously operating and whilst I do agree that it is a strange /odd effect, I have learnt to live with it, in fact and to be completely honest, I had forgotten about the effect until that is reading your post reminded me.

All in all and no matter how you look at it, the UV-3R (MK I or II) really is, nothing short of fantastic value for money.

73,
Geoff, G8DZJ.

Hi Carl. Yes this is the way it works. It's the digital processing just kicking in with the new signal, then finding the signal is strong enough to pass the top audio frequencies. If it's a pretty weak signal the DSP keeps the top frequencies cut, just like a low pass filter. If this happens, I've found that if the op keeps talking the dsp will slowly pull their voice out of the noise....

The delay is because most of the signal processing after the front end RF stage is digital. The same goes with the delay in the squelch opening, about half a second..... This can be a problem for those who wish to use the rig on packet.

BTW, my rig is a Mk.I (18 menu) and presume this is the same on the latest Mk.IIs (19 menu)?

Regards, David G4TUP.

> Anyone else have this problem, is it just the way it works?

It's not really a problem than a feature:
As long as the signal strength is below a certain level, the DSP reduces the bandwidth of the RX path to suppress unwanted noise on the audio signal. Once the signal strength is high enough, the DSP switches to a broader bandwidth.
What you are reporting is right the effect when the DSP switches over to the broader bandwidth. This is common, when the receiving signal's strength is close to the switching threshold of the DSP.

When did you purchase yours? I bought my Mk.I (18 menu) mid-August, its ser.no. is

311 061 5298

I have two friends who bought them a couple of weeks later. Will try to get theirs.

That sounds about right to me. And by sorting by serial number we can see changes that happen during the rig's progression.

And a good Festive Season to one and all!

David.

From: Music Maker
Topic: 3775 Message: 3778

I think that you must take into account that Wholesalers/Retailers will buy these radios from the Manufacturer in large batches - possibly by the 100's, or more.

1. There will be a large discrepancy on Serial Numbers, as different sets are sent out to each outlet, and then...

2. It may take one several months to sell them all, and onother will sell theirs in days.

I would think that one I buy, say from Hong Kong or China, may well have a number that is 2 or 3 thousand different to one I buy in UK or USA.

Of course, they were numbered in sequence as they were manufactured, which will have some relevence - once all radios up to those numbers are sold - and they sell hundreds a week !!

I have just ordered 2 from China, and will report No's when they get here in a couple of weeks time.

Kind regards & Seasonal Greetings,

John (G3OBU)

Thanks for the clarification. I'm starting to see that Mk II's may have 19 and Mk I has either 8 or 18 (more data needed to be more sure of this) -- what is your serial number, and where/when did you get it? Any other behavior or differences we should note?

Just got my mkII and vhf/uhf step are independent of each other
it can also be set (and works) in the software (uv-3r software). I have also noticed that my volume control works well (as opposed to what is reported in the FAQ)
my ser # is 3110414647
purchased from Hawaiiradiosales.com

Mine is louder if I talk into the mike hole on the radio. Talking above or below the mike hole gives lower audio.
Also the small hole in the mike cover does not always match the hole in the plastic case. You can open the radio and enlarge the hole in the rubber mike cover. This will allow it to line up better with the case. - Jerry

3795. Hardware FIX low power on LOW POWER VHF

Yahoo group: UV-3R (2011)
Date: 2011-12-26 02:50:54 UTC
From: sp2swj
Topic: 3795 Message: 3795

Hi

This is my first post on this group - so... Hello to all !

I read in FAQ:

"Low power on VHF "low" setting.
Many UV-3Rs users experience a very low power output on the VHF HAM band in "low" setting. It has been measured to be at around 100mW at 145 MHz instead of the advertised 1W. This behavior is normal and there is no hardware fix"

... but I FIX this problem by hardware change one inductor in first stage RF VHF amplifier.

http://www.youtube.com/watch?v=4P_O86ridVA
http://sp-hm.pl/attachment.php?aid=3755

This FIX was done after some measurement and "investigation" using oscilloscope.

73!!

SP3SWJ

PS. after this change - harmonics now is less and sinus looks like sinus (before was something like saw-triangle)

3796. Hardware simple FIX - TX lock on VHF using the supplied earpiece

Yahoo group: UV-3R (2011)
Date: 2011-12-26 03:08:13 UTC
From: sp2swj
Topic: 3796 Message: 3796

Hi I read in FAQ

"TX lock on VHF using the supplied earpiece.
This appears to be due to RF being picked up on the cord. ..... Others have suggested a SMT bypass capacitor of about 100pF internally on the PTT line"

Simplest method is add 100nF parallel in external PTT switch

http://www.youtube.com/watch?v=NskGWtg4VM0

Adding internal capacitor on PCB is "little hard" :-) ... and second reason. this is data line to uC communication... so not so good is block this line using capacitor.

73!

From: g4ilo
Topic: 3796 Message: 3801

It didn't work for me. :(TX still locks on. I then put back the two turns of cable through a small clip-on RFI suppression ferrite right next to the plug and PTT works OK again.

I think the problem is there is a lot of cable between the mic/ptt switch and the socket on the rig. The capacitor needs to be at the plug/socket end to have a chance of getting rid of the RF on the cable.

PTT line is used in two cases
- PTT line
- serial communications between PC and radio

...unfortunately this line go directly from socket to uC without any RFI lowpass filter. Best method will be add some low pass filter on this line - but this radio is to small to solder something like this inside :-(

When You put to DATA line some capacitor there is possible communications problem using SERIAL cable...

Best method will be change this simple cable to shielded and add 100nF to PTT switch... but new cable .... new JACK plug... and possible is add 100nF SMD 0603 directly on JACK :-)

Hi Jerry. Yes we tried talking direct into the mic hole so I guess it must be the mic cover doesn't match the hole in the plastic case.

I just got the ser.no. off another friend, let's call him D2, who has a Mk.I with no tx audio problem yet a similar ser.no. to my friend M. The ser.no of D2s is

311 060 5330

.d. G4TUP.

I add some measurement result.... :-)

HI POWER +33 dBm
2nd harmonics -27 dB
3rd harmonics -41 dB

VHF power and harmonics before and fter FIX

before FIX
LO POWER +16 dBm
2nd harmonics -10 dB !!!!!!!!!!!!!!
3rd harmonics -44 dB

after FIX
LO POWER +31.4 dBm
2nd harmonics -27 dB
3rd harmonics -47 dB

all measurement made using Motorola R2670 on SMA antenna port

Very interesting... did you verify the 1 W output across the complete VHF range?
This might be THE solution to fix the low power on VHF.
In addition, the modification of the earlier published low-pass filter circuit (adding just 1 capacitor) to fix the 2nd harmonics problem could be the solution for all the 'old' UV-3R's for bringing them close to the 'normal' specifications similar to UHF!
Thanks a lot for sharing this!

Hi

I have osciloscope working up to 300 MHz and I track (measure) RF signal from RDA1846 .... from chip..>>>>.. to antenna (in this time antenna port was terminated on second channel 50 ohm ... or R2670 (depend on performed test)

Signal from RDA is almost SINUS :-) ... problem was in this place what is shown on scheme....

When i put oscilloscope RF probe (1:10) to this point... OUTPUT RF signal change from "triangle" to sinus :-)

This transistor RF driver not work "stable" on 155 MHz signal is sinus and low power VHF is ~~ 0.8W but down to 145 MHz RF power decrease and sinus change to "triangle"

... Anyone who have this "low power problem" can perform simple TEST... just on LOW VHF power touch by finger this point... and measure RF signal on ANTENNA port.

Not good idea is "filter" bad harmonics... we must first identify the source of distortion and eliminate them ...

73 !

I forgot to answer...

"did you verify the 1 W output across the complete VHF range?"

Yes I measure.. in whole VHF range... now "low" power is to high ... maybe wee need change BIAS level signal (decrease)...

I measure RF every 5 MHz... bot not remember where i have this note ... im not interested working outside HAM band...

.... search and found... my post on other forum..

measurement before FIX...."magic" QRG is 150...151 MHa

140 MHz 0,01 mW
145 MHz 0,06 W

150 MHz 0,1 W
151 MHz 0,25 W
155 MHz 0,4 W
160 MHz 0,6 W
170 MHz 0,8 W

after FIX...

LOW 1,3W on 136....145MHz
155 155MHz 1W

HI full range 2W.... :-)

3810. battery charger used once only

From: R O
Topic: 3810 Message: 3810

After charging my battery once, the charger died with zero output power. However, I am getting a new one sent to me from radio888. Has anyone experienced this problem? How do we take apart the charger?
Radio works ok but haven't got the test equipment to check other faults as reported in this forum. Software problem is still ongoing. Programmed twice that was it. Reset radio still unable to program 3 radio. Down loaded new versions, tried old versions, tried different PC s, yes the programming lead was plugged all the way home. I guess if Baofeng listened to the forum and fixed all the problems they would come up with a good product. Yes, its all to do with the cost $53.00 delivered to my door in australia.
Hope you all had a Merry Xmas and Happy New Year to everyone in this forum

Richard,

I got the problem twice. First time smoke came out. Received replacement within a week from 409 shop. Second one died yesterday when trying to use it for the second time.
First one had an exploded capacitor C1 and more burned resistors and defect transitors probably as a result of the failing capacitor.
The second one had a defect R1 which is acting as a fuse. No more investigation done.
At the backside (connector) of the charger you see a label. Under the label is a hole with a screw. With this screw you can open de charger.

This may be a dead question but I was wondering if anyone knew if there was an adapter available or one I could build to adapt the two jack motorola style speaker mic with the single jack baofeng? There are very few styles of the single jack out there. Thank you in advance. I'd even pay someone to build it for me.

Ted.

The Yaesu FT60 has the same type of external speaker jack. You might look at the two prong adapter (CT 44) they have. I have one but have not tried it yet and do not know if the pin out would be compatible. Will give it a try and report though.

3818. Priority function question

Yahoo group: UV-3R (2011)

From: Bart KA7ZFD
Topic: 3818 Message: 3818

Still trying to figure out the Priority channel stuff, and it seems to be linked directly with Dual Watch. The note on DW in the FAQ seems to be related to the Mk I or early version Mk II - since on my Mk II it will go back and forth between upper display and lower display whether in VFO or Memory mode rather than just in VFO mode as mentioned.
In the manual that came with my later model Mk II it states that Priority Mode "-- allows you to operate between UHF channel and VHF channel in the VFO mode, while periodically checking a user-defined channel for activity." This appears to me to say that it will check the "user defined channel" (Priority channel is memory location #1 according to the Baofeng programming software) when in VFO mode while scanning back and forth between the VHF and UHV VFO's while in VFO mode. To prove the theory and see if Memory channel 1 breaks in while in VFO mode while listening on another radio for activity not found on the priority channel while in DW mode on the UV3R -- (I have memory 1 on our local calling repeater as it is the most used freq locally for this test) I tried various setups of VFO/Memory mode. After a couple days trying it out it seems Priority 'on' does nothing with or without DW also turned on , and still testing with DW active as mentioned with no activation of the Priority channel even when that freq is transmitting (meaning the repeater being used), so I don't know if it is actually an implemented feature yet. The Priority channel feature may be a 'vaporware' so far. Any thoughts, differing observations or results from the Group? Thanks for any insight!

These chargers can barely support the current they are supposed to be rated at. You want one that can deliver 1000mA at 5V to be on the safe side.

I made my own charging cable by splicing the plug on to a spare USB cable. (Power is on the outer two wires, use a meter to check polarity.) Now I can charge my UV-3R from any computer or any adequately rated USB charger of which I have quite a selection.

Planning to cobble up my own adapter - 2 jacks for headset, one for PTT.

Use an inline PTT switch and the simple (inexpensive) Labtec Axis 311 headset/mic (if the mic and earphones impedances are right...). Simple things for simple minds. Might be a couple months down my to-do list, though.

Two reasons for adapters -
1. Attaching new plugs to 2-3 small coax cables is a challenge

2. Most importantly, it allows replacement or substitution of the components.

Just thinkin'...

I'm glad you brought this up. Some time back a friend of mine got me a Minty Boost kit for my cell phone:

http://www.ladyada.net/make/mintyboost/

It lets you use either two or four AA batteries (depending on how you build it) to provide +5V through a USB cable. I haven't seen any mention of a AA battery pack for the UV-3R, and figured some adaptation of the Minty Boost might not be a bad way to go.

Has anyone tried this? A 4xAA version sized to provide 1000mA might be a nice accessory to have.

Let me throw another idea into the pot:
My "RF intuition" suggest that it just might prevent the inadvertent PTT activation if the PTT and Ground (earth) wires were simply twisted together (e.g. several twists per inch). I've not had an opportunity to this this!

Hi Bart,

I came to the same conclusion. The UV-X4 and the UV-3R appear to be the
same radio with the exception of the shape of the buttons.

I tried to compare the manuals however this is a dead link

http://www.verotelecom.com/manual/UV-X4.pdf

3827. computer programming some TX arent rounding off like before

Yahoo group: UV-3R (2011)
Date: 2011-12-27 21:24:39 UTC
From: roz062852
Topic: 3827 Message: 3827

ILL explain about two weeks ago i tried and turned on radio and all 34 repeater splits disappeared.I tried going back to version1.07,this is not markII.I sarted to reprogram but of 8 splits a few just onTX are not rounding off.Ex 6400 became6399.This has not occured on RX side.

I sent radio back to Austin Amateur supply where i got about 3 mos ago.He said nothing wrong with radio.

Thats partly true it reads from and writes with digit problem.
Im sure this has been addresed but is there a simple fix,I put call back to ealer

Thanks David WA2MZZ

3828. Re: Priority function question

From: stevebirch01
Topic: 3818 Message: 3828

OK, I admit defeat.
I can't seem to make the Priority function do anything useful.
I can set a priority channel in the 1.10 software, and indeed that does make the "PRI" setting go from "OFF" to "ON". Apart from that, I cannot detect any difference in operation.
I've tried both radios I have here - no difference.

Interestingly, if I read BACK from the radio after programming a priority channel, it comes back with the Priority channel number as "OFF", which suggests to me that the radio hasn't even stored it.
(I get a similar effect if I try to program different step frequencies with the 1.10 software : On my example of the radio which has a common step for both VHF and UHF, the UHF step always reads back as "5k" regardless of what I tried to program. On the other hand, my example of the radio that allows UHF and VHF to be programmed independently always reads back both UHF and VHF steps correctly.)

3829. Dumb ignorant newbie post of the day.

Yahoo group: UV-3R (2011)
Date: 2011-12-27 22:41:43 UTC
From: Adam
Topic: 3829 Message: 3829

I've done a search for my question, but I'm not finding anything (although I'm sure it's been covered). So, if anyone can help a dumb newbie out, I'd greatly appreciate it.

For the most part, I have this radio (UV-3R Mark II) figured out, despite the lack of an understandable manual. I was able to program in one of our local repeaters (manually; don't have the software yet), and when I key up, it opens the repeater (I was monitoring with my scanner), so I knew I was on the right track. Stored it to memory channel #1 following the manual's directions. Programmed a couple more repeaters, and everything appeared to go well.

Now here is where my question comes in, and the answer is probably so obvious I'm totally overlooking it. I appear to be having trouble switching between VFO mode and memory mode. I follow what the manual says (pressing and holding the UV/Mode button), but then when I try to "step" through the channels, it looks like I'm still in the VFO mode.

Is there anyway to tell for sure which mode I'm in? When stepping through the channels, does it display on the top line, the bottom line or both lines?

Any assistance will be greatly appreciated, and many thanks in advance.

p.s. hope my rambling made sense, if not, i will try to clarify as needed depending on responses.

3830. Re: Dumb ignorant newbie post of the day.

Yahoo group: UV-3R (2011)

From: stevebirch01
Topic: 3829 Message: 3830

Welcome to the group! Anyway, it's not a dumb question at all.
On my UV-3R Mark 2 (the one with 2-line display), when you switch to memory mode, the memory frequency always appears on the UPPER line of the display.
You can tell that you are in memory mode because the memory channel number (not frequency) appears as two small digits above and to the left of the upper frequency.
If you can't see the memory channel, you probably didn't press U/V for long enough. (A short press of U/V merely switches between UHF and VHF VFOs and the little "-" to the left of the frequency display toggles between upper and lower lines)
A long press of the U/V button is also used to switch back from memory mode to VFO mode of the upper display.

Hope this helps.

> For the most part, I have this radio (UV-3R Mark II) figured out, despite the lack of an understandable manual. I was able to program in one of our local repeaters (manually; don't have the software yet), and when I key up, it opens the repeater (I was monitoring with my scanner), so I knew I was on the right track. Stored it to memory channel #1 following the manual's directions. Programmed a couple more repeaters, and everything appeared to go well.
>
> Now here is where my question comes in, and the answer is probably so obvious I'm totally overlooking it. I appear to be having trouble switching between VFO mode and memory mode. I follow what the manual says (pressing and holding the UV/Mode button), but then when I try to "step" through the channels, it looks like I'm still in the VFO mode.

Aloha All,

I am new to the group and have at least one question I just received my UV-3R MKII today I also have the serial programing cable since my computer has com ports. Operating system is Win 7 Ultimate and the software is Ver 1.08. I entered all the frequencies in the software and when I try to connect to the radio on any of my com ports I get the Cant OPEN message even though I have the radio on and the correct com port. Where am I going wrong? Am I doing everything I need too? Please help.

Make sure the plug is really pushed into radio. I had to do it several time to read radio.

I find it best to watch the very top of the display whilst doing this and hold down the key until the memory channel numbers appear as this can take considerably longer than the manual suggests, probably 3-5 seconds on my mk II.

Hope that's helpful.

Hi David. I don't use the programming cable so can't comment authoritatively on this, but it was discussed awhile ago and I seem to remember the answer was to use the very latest Mk.II software, even with Mk.I rigs..... But you must download the memories into your PC software before using that file then to upload after modification of freqs.....

Perhaps someone in the full know can confirm?

Regards, .d. G4TUP.

Hi Julian. Yes, you do tend to collect USB chargers, what witth mobile phones, MP3s, cameras etc! Unfortunately I've found that one of my USB chargers is 330mA, a couple of them are 500mA, and isn't the output of a PC regulated to 500mA maximum? Obviously this would lengthen the charging time. Also, would they support the rig if it's used on transmit whilst connected?

Regards, .d.

Gentlemen,
I just uploaded a file into the FILES section that will help:
"PL2303_Prolific_Vista-Driver_for_Win7.zip"
Interestingly it is a VISTA driver for the PL203-USB-Prog.-Cable, but I have noticed this as the one and only, which will work fine for Win7 without any trouble! Also the most up to date Win7 driver-file to be found on whose site, DOES NOT WORK!
Furthermore you might have to set the com-port-properties (from your PC)to speed 1K2, as 8N1 as well!

If the driver is installed and the com-port settings are done:
- Connect the radio to the cable, but do not switch the radio ON
- Start the software (use version 1.10, which will work for both: MK1/2)
- Use SETTING/ComPort inside the Program to set for YOUR ComPort!
- Hit READ
- NOW switch the radio ON
- BINGO - You are done!

Regards to everyone!
73 de Udo,
OE8MCQ

I'm using Windows 7 (x86 PRO) and I bought a few month ago an UV-3R wwith the usb cable and software programming.
I was not enable to make the drivers from the supplied CD here you can find driver which works perfectly on my system and with older and newer UV-3R programming softwore.
The link is http://www.thiecom.com/ftp/software/treiber/prolific/usb/ and the file is usb_vista09.exe

Hope it will work for you

From: g4ilo
Topic: 3810 Message: 3848

I tried a Chinese 500mA one but the battery never fully charged so I don't think it was up to spec. OTOH a charger from an EU mobile phone worked OK. I think Chinese milliamps nust be smaller than ours. :)

I have charged the radio from a computer USB port and haven't had any problem although it has been a top-up charge, I have never fully depleted the battery.

I don't think you can use the charger port as a power supply input. There's a regulator in circuit that monitors the charge state and flashes the battery icon.

Julian, G4ILO

Topic: 3814 Message: 3849

Good Question. I have had it long enough that I forgot. I think I got it from Quicksilver Radio, So it is probably a pyramid. Sure not a high end item.

3850. Re: Priority function question

Yahoo group: UV-3R (2011)
Date: 2011-12-28 18:04:51 UTC
From: Bart KA7ZFD
Topic: 3818 Message: 3850

Fascinating Steve -- I hadn't tried reading it back to see any effects, but it does make sense considering the early and later Mk II's different step setting functionality. Perhaps it is an artifact from this radio seemingly being designed for the commercial market?

--- In UV-3R@yahoogroups.com, "stevebirch01" <stevebirch01@...> wrote:
>
> OK, I admit defeat.
> I can't seem to make the Priority function do anything useful.
> I can set a priority channel in the 1.10 software, and indeed that does make the "PRI" setting go from "OFF" to "ON". Apart from that, I cannot detect any difference in operation.
> I've tried both radios I have here - no difference.
>
> Interestingly, if I read BACK from the radio after programming a priority channel, it comes back with the Priority channel number as "OFF", which suggests to me that the radio hasn't even stored it.
> (I get a similar effect if I try to program different step frequencies with the 1.10 software : On my example of the radio which has a common step for both VHF and UHF, the UHF step always reads back as "5k" regardless of what I tried to program. On the other hand, my example of the radio that allows UHF and VHF to be programmed independently always reads back both UHF and VHF steps correctly.)
>
> - Steve
>
> --- In UV-3R@yahoogroups.com, "Bart KA7ZFD" <ka7zfd@> wrote:
> >
> > Still trying to figure out the Priority channel stuff, and it seems to be linked directly with Dual Watch. The note on DW in the FAQ seems to be related to the Mk I or early version Mk II - since on my Mk II it will go back and forth between upper display and lower display whether in VFO or Memory mode rather than just in VFO mode as mentioned.
> > In the manual that came with my later model Mk II it states that Priority Mode "--allows you to operate between UHF channel and VHF channel in the VFO mode, while periodically checking a user-defined channel for activity." This appears to me to say that it will check the "user defined channel" (Priority channel is memory location #1 according to the Baofeng programming software) when in VFO mode while scanning back and forth between the VHF and UHV VFO's while in VFO mode. To prove the theory and see if Memory channel 1 breaks in while in VFO mode while listening on another radio for activity not found on the priority channel while in DW mode on the UV3R -- (I have memory 1 on our local calling repeater as it is the most used freq locally for this test) I tried various setups of VFO/Memory mode.
> > After a couple days trying it out it seems Priority 'on' does nothing with or without DW also turned on , and still testing with DW active as mentioned with no activation of the Priority channel even when that freq is transmitting (meaning the repeater being used), so I don't know if it is actually an implemented feature yet. The Priority channel feature may

be a 'vaporware' so far. Any thoughts, differing observations or results from the Group?

From: Bart KA7ZFD
Topic: 3810 Message: 3851

Interesting little kit! Thanks for the link, I may have to make one --
I do have a commercial equivalent though (link below), and it works well for keeping my GPS, scanner, camera, etc batteries charged when traveling and runs my cellfone for a lonnnnggggggg time --- It only takes a couple hours or so on average to recharge 2700 MAh 4xAA battery pack with the solar cells sitting on the dashboard in the sun -- When I receive the USB charging cable I ordered a couple days ago, I'll try charging my radio from both the battery pack and the solar panel to see how well it works.

3852. Re: Programing the UV-3R Questions

Yahoo group: UV-3R (2011)
Date: 2011-12-28 18:28:35 UTC
From: ah6rr1
Topic: 3832 Message: 3852

First off I am NOT using a USB/Serial converter cable I am using a Serial cable so the prolific chipset drivers are not the problem. Does anyone have the pinout for the serial port programing so I can check the cable I bought? I think that is were the problem is since I control my HF radio and HB CW/FSK keyer just fine on my com ports.

3853. Re: Use Mark II as UHF only

Yahoo group: UV-3R (2011)
Date: 2011-12-28 18:42:07 UTC
From: Chris KF8ZR
Topic: 2878 Message: 3853

how did you end up with dual banders but only have a need for mono band radios?
Would the group be willing to sell off the dual banders and buy single band UHF radios?
No use in having the VHF band if they get lost when they press one button.
Just a suggestion.

Topic: 3854 Message: 3854

Hi,

I reported a broken link on the Vero site and was emailed the manual for the UV-X4. To be honest I can not see any difference to the UV-3R.

The manual is 6meg and is too big to be posted to the files section. Please email me if you would like a copy.

Hello Shaun,

As you may know, this is a very popular model in Market. So there are many factories copy it in China. If you want to work out their difference, we suggest you can buy some samples for testing and compared with their difference.

Any requirement please feel free to contact us.

Thanks and Best regards

Hi,

I reported a broken link on the Vero site and was emailed the manual for the UV-X4. To be honest I can not see any difference to the UV-3R.

The manual is 6meg and is too big to be posted to the files section. Please email me if you would like a copy.

Shaun

Hello Shaun,

As you may know, this is a very popular model in Market. So there are many factories copy it in China. If you want to work out their difference, we suggest you can buy some samples for testing and compared with their difference.

Any requirement please feel free to contact us.

Thanks and Best regards

Tina

3859. Re: Programing the UV-3R Questions

Yahoo group: UV-3R (2011)
Date: 2011-12-28 20:25:03 UTC
From: ah6rr1
Topic: 3832 Message: 3859

Ok I opened the Serial cable I bought and it has a circuit board with a MAX232 chip all the wires are connected to the correct parts of the 3.5MM plug Tip 2nd Ring and Sleeve. I found my older USB/RS232 Converter with the Prolific Chipset tried that and still not reading/writing to the radio. Loaded the software into my laptop that has XP and still the same. But when I tried Chirp Software on the desktop I was able to get a new message before I was getting "Radio Failed to send ACK" now it says "An Error Has Occurred" "Failed to Read Full Block (18!=20). I bought the cable from "radioshop888" on eBay and so far no response from them on the questions I have asked them. I sure hope it is the cable and not the radio. Any Suggestions?

Roland AH6RR

I spoke with John at Austin Amateur radio today and after trying a number of things he encountered same problem I had , a number of TX frequencies did not roundoff.

He tried on his computer and it did what I encountered.He was sending email to MFG ,his software on his business wbsite newest version 1.07 for non mark II radios.

Ill keep everyone informed.I will try CHIRP and see if that helps.

3861. Programming via computer - problem

Yahoo group: UV-3R (2011)

From: invrad
Topic: 3861 Message: 3861

Hi all,

I finally received the UV-3R programming cable and software and attempted to use it, but ran into a small problem: Once loaded, the main programming window comes up, but there is nothing under the "Help" menu to tell me how to use the programming software. When I click on either one of the "Help" functions (toolbar, or the question mark icon), there's nothing.

I tried loading the program from the mini CD and also from another website -- same result.

Anyone know if this is a corrupted version? (It's version 1.07). I'm usually intuitive with these programs, but not *that* intuitive with this one (in other words, I ain't psychic!).

Any advise appreciated....thanks!

3864. Re: [UV-3R] Programming via computer - problem

Yahoo group: UV-3R (2011)
Date: 2011-12-29 00:50:05 UTC
From: Dan Morrison
Topic: 3861 Message: 3864

I am using version 1.01.01, 2010 10 08 and it set up fine on this 64 bit Windows 7 laptop. Have not set it up in my station computer - 32 bit Windows XP machine - yet.

Only Help -> About works. Help -> Index does not. Had to go to 3rd parties for help - and there is lots out there.

Look at Programming the Baofeng UV-3R From a PC<http://www.essexham.co.uk/news/programming-the-baofeng-uv-3r-from-a-pc.html> and Setting up the Baofeng UV-3R for GB3DA Danbury Repeater<http://www.essexham.co.uk/news/setting-up-the-baofeng-uv-3r-for-gb3da-danbury-repeater.html>

I had a problem with USB driver for this 64 bit computer - had to look around...The CD with the radio was useless - wrong driver, and Chinese language GUI.

I hope what I shared may be of help - I have a talent for making simple things complicated - and for answering the wrong question. I learned that from politicians......

Dan

"It is not the style of clothes one wears, neither the kind of automobile one drives, nor the amount of money one has in the bank, that counts. These mean nothing. It is simply service that measures success."

I had lots of connection failers with pc.
Problem eventually solved. The program plug was not making a full connection.
With a scalpel I removed an extra bit of the the plug plastic moulding thus allowing the the 4 ring plug to insert fully/further.
Connection sucesss.work everytime now.

if you use a frequency counter and the input or transmit frequency if only off by .0001 would it really cause a problem getting into the repeater?

What happens when you use the manual programming technique instead of the software? Are you still stuck with the frequency not rounded off?

Date: 2011-12-29 18:35:11 UTC
From: Bart KA7ZFD
Topic: 3827 Message: 3871

It would seem to be just a math thing -- a rounding error in the display driver. A good freq counter (resolution within required freqs) checking the output would hopefully show the actual output freq, and that will vary a bit regardless, on any radio. Sounds like a non-issue to me, just a slight irritation at most.

3872. Re: Stupid Question

Yahoo group: UV-3R (2011)
Date: 2011-12-29 19:06:12 UTC
From: Bart KA7ZFD
Topic: 3865 Message: 3872

This is a very good question, not a "stupid" one.
Lets step back and look at what the two sections of the screen really show.
In the Mk I, there is only one freq line displayed, and it will show one of three items. It will show the UHF VFO, the VHF VFO, or the memory channel which can be programmed as either VHF or UHF.
This same idea is used in the dual freq screen of the Mk II, X4, etc radios as they are fundamentally the same machine with just a few minor differences, primarily in the display area.
In VFO mode, the upper display is the UHF VFO and the lower is the VHF VFO, which is a nice improvement visually but not really functionally that much different. The confusion comes when the Memory channels are shown because they are shown in the upper display area only, replacing the UHF VFO freq display. Again, it is functioning the same as the Mk I in that respect, but because you can still see the VHF VFO below, and can move the received mode icon (the dash that shows either upper or lower display area as active) with the U/V button rather than cycling through the single display items as in the Mk I, it appears as if you have more than one channel active, which you do not. The radio only looks at ONE freq at a time, whether on VHF or UHF or whatever is in memory.
When using Dual Watch, you can then move between the upper and lower display in the Mk II versions, and in VFO mode that means between VHF and UHF; but when in Memory mode, the Memory can be either VHF or UHF, and the lower display area is still (always!) VHF, so that is why two VHF channels can be monitored with only one UHF can be at the same time and is the primary difference between the two major versions (Mk I vs Mk II).
I do not know the actual button pushing routine of this in Mk I models since I have a Mk II, and do not consider this a drawback since only one VFO can be active at a time anyway.
In my own and some others testing, the Priority function has no effect other than changing the "off" and "on" indicators (wow - big whoop). Lets hear from those who have made that actually work (actually scan between a vfo or memory and the Priority channel which is memory location 1), and what the serial numbers of those radios are so we can document the functionality and publish it in the FAQ.
I hope I didn't confuse anyone, and hope any variations can be shown and listed in the database.

Bart,

My UV3-R says Mark II on the box. Is there a certain place to download the software for this rig? I can't get cable to work with the computer...or is that unrelated?
The little DVD from the 409 shop didn't work with my computer (Toshiba laptop running XP)

Is there a different manual for Mark II?

Thanks in advance,
Sandy

Subject: [UV-3R] Re: Stupid Question

This is a very good question, not a "stupid" one.
Lets step back and look at what the two sections of the screen really show.
In the Mk I, there is only one freq line displayed, and it will show one of three items. It will show the UHF VFO, the VHF VFO, or the memory channel which can be programmed as either VHF or UHF.
This same idea is used in the dual freq screen of the Mk II, X4, etc radios as they are fundamentally the same machine with just a few minor differences, primarily in the display area.
In VFO mode, the upper display is the UHF VFO and the lower is the VHF VFO, which is a nice improvement visually but not really functionally that much different. The confusion comes when the Memory channels are shown because they are shown in the upper display area only, replacing the UHF VFO freq display. Again, it is functioning the same as the Mk I in that respect, but because you can still see the VHF VFO below, and can move the received mode icon (the dash that shows either upper or lower display area as active) with the U/V button rather than cycling through the single display items as in the Mk I, it appears as if you have more than one channel active, which you do not. The radio only looks at ONE freq at a time, whether on VHF or UHF or whatever is in memory.
When using Dual Watch, you can then move between the upper and lower display in the Mk II versions, and in VFO mode that means between VHF and UHF; but when in Memory mode, the Memory can be either VHF or UHF, and the lower display area is still (always!) VHF, so that is why two VHF channels can be monitored with only one UHF can be at the same time and is the primary difference between the two major versions (Mk I vs Mk II).
I do not know the actual button pushing routine of this in Mk I models since I have a Mk II, and do not consider this a drawback since only one VFO can be active at a time anyway.
In my own and some others testing, the Priority function has no effect other than changing the "off" and "on" indicators (wow - big whoop). I had the same problem and fixed it like this.

Identify the memory channels with the problem. Write to the radio.

Manually, using the radio, re entre those memories with the correct freq.

Read from the radio back to the software and all was good.

The provided software was useless for me, too. The USB driver only worked with 32 bit computers, and, though the install function was in English, the software GUI was Chinese.

Searched around and found driver and software than worked fine. The English GUI, though, was installed with Chinese instructions. Just press "Enter" for each Chinese language step - the default button is the right one.

Where did I find this info?

A great How-to page:
Programming the Quansheng TG-UV2 from a PC<http://www.essexham.co.uk/news/programming-the-quansheng-tg-uv2-from-a-pc.html>

And where is the software I use with my Mk I? Linked on the page above:

www.radiogearpro.com/download/USB_Drivers_64_bit_4.2.0.zip (Same filename as the 32 bit version.....)

http://www.409shop.com/shop_displaynews.php?id=292 (TG-UV2 software needs a RAR extractor, such as Frog <http://free-rar-extract-frog.pwpw.de/>) "When you first run the program, you'll note it's all in Chinese, save for one word on the menu: "English". Press this, and it should switch language."

Anyway, it was hit and miss for a while.....

Dan

"It is not the style of clothes one wears, neither the kind of automobile one drives, nor the amount of money one has in the bank, that counts. These mean nothing. It is simply service that measures success."

Yes, you can scan UHF UHF by programing both VFOs at UHF. I remember reading about it on the group somewhere.

So add this to the ini file before opening the programing software:

p.s. I have not tried this:

Freq3=[400-500/400-500]
data3=0040994900409949

Now tyou can program a UHF freq into the old VHF VFO

3879. Anyone managed to make PRIORITY function do ANYTHING on a Mark II??

Yahoo group: UV-3R (2011)
Date: 2011-12-29 20:34:26 UTC
From: stevebirch01
Topic: 3879 Message: 3879

This topic has been touched upon before, so my apologies but I wanted to pose the question very directly to the group.
Note that this question applies to MARK 2 radio ONLY.
I have two Mark II radios which appear to have different firmware (evident from varied behaviour of STEP function), but I can't seem to make the PRIORITY function (MENU 19) do anything on either of them.
I have confirmed that I can switch the function ON or OFF with the 1.10 control software, and even set a priority channel number, but nothing else seems to happen.
I've tried with Dual Watch (DW) both ON and OFF, VFO mode and Memory mode, While scanning VFO and scanning memories etc.
If anyone HAS made it do anything, let me know what version of control software you are using!

Thanks !

- Steve

The little supplied CD/DVD I received was also worthless. I needed to download both the USB driver and programming software, and found the links listed in the FAQ. The main vendors all have the software or links to it on their sites, and the best are listed in the FAQ along with answers to your other questions like getting the cable to work. Paolo and the others have done a great job putting the FAQ together; a most useful resource.
Click on the "Files" listed on the left of the Yahoo Groups page and open the folder called FAQ. The newest one is noted by it's 'created' date or the file name "UV-3R_FAQ_2011-12-22.pdf" which includes the created date. Remember to download your radio to the computer and save that file as the original before uploading any changes.

Anyone tried this using a reflected power reading? I suspect the SWR would be atrocious since the power amp for the lower vfo seems to be tuned for just above the 2 meter ham band

Just acquired a UV-3R on 27 Dec 11 via the 409Shop. S/N 3110801256, with the camo case. I have not looked at it on a service monitor, but plan to do so in the near future. No commentary yet as I am still learning my way around it. I did order two more, however, and I am using my VX-2R 1000mah batteries as spares, temporarily.

*open your device manager, and click the + next to com and lpt ports. plug in your cable and see what com number it comes up as. If nothing happens, you either don't have the drivers installed, have a bad USB port or a bad USB adapter...

Hope this helps.
Happy New Year!

Check out message number 3868, 3864, the UV-3R FAQ, and search other postings. The answer is in there -- good luck, this is a great little CHEAP radio --

3890. Re: Anyone managed to make PRIORITY function do ANYTHING on a Mark II??

Yahoo group: UV-3R (2011)
Date: 2011-12-30 22:11:20 UTC
From: mikep_n4mep
Topic: 3879 Message: 3890

I have a MkII (19 Menu Items) and V1.10 of the software. My radio seems to only have one step value setting for both VHF and UHF.

In the software if I set the Priority Scan on (box checked) and set the Priority Channel to a memory location (01 in my case). My Scan Mode is 'TO' by default.

After writing to the radio it will switch the UHF (top freq display) back and forth between channel 01 and whatever frequency was shown, be it a memory channel or a UHF freq.

If squelch is broken it will stop the switching back and forth as long as a signal is received.

So it does work for me.

Serial Number is: 3110812829

From: Anthony
Topic: 3891 Message: 3891

In the software I downloaded to program the UV-3R, the "Name" box is greyed out and will not let me put in a channel name. Is this just my software or are all of them like that?

Thanks,
Anthony

3892. Regular old headset

When I try to plug just a regular pair of headphones in to the uv-200 it keys up to transmit and if I wiggle it around it will stop but I only pick up audio out of one side. I am unable to controll volume at all while they are in. Any suggestions as to a way to make a regular pair of headphone work for just listening?

In the UK they are available here:

http://www.maplin.co.uk/3.5mm-4-pole-jack-plug-29686

For those who don't know Maplin, they're a main supplier to the hobbyist,
although not particularly cheap. I would have thought these 4-pin plugs
were available in the US, Europe and other technological areas?

.d. G4TUP.

P.S. the wiring for these plugs is available in the files section.

I got a pack of 4 very cheap from China on eBay. They have 4 tags for wiring so they are fairly easy to solder to. The one I got from a UK source (I forget where now) had like concentric rings for each of the contacts and it was hard to solder without melting the plastic and destroying the plug.

From: Sparks
Topic: 3898 Message: 3898

To ALCON (and Steve!)

I should have been more detailed re: my new radio. It is the Baofeng UV-3R MK II, two-line display, 19 item menu, camo case, and - again - the s/n is 3110801256, from the 409shop. I do have two more on order, arriving around the end of Jan/2012.

So far, there does not appear to be anything in the menu that cannot be accessed via the keyboard - however, I probably have just not found the quirks as yet. While I have the cable and software, all of my entries have been via the front panel...

My primary use is as a Part 90 radio and so far, so good.

V/R,

David J. Ziskin
AG6E

It is in the database now David -- thanks, and please let us know if we should add any notes on operation, functions etc. Look at the database for things others have noted. When you update us on anything, referring to the Serial# allows updating of your entry in the database.
btw, also use mine on Part 90 along with Ham use -- not many radios that is allowed for Bart

Take a look at Mouser part 172-7446-E This connector should fit the radio. The cable has bare leads to allow you to connect just audio out for you head set. The other wires can be just terminated.

Julian,
Do you recall the seller that had these on eBay?

From: frank
Topic: 3903 Message: 3903

I seem to have low power (bought it used) with about 200 milli-watts out on both bands on high power, lower on the low power position, any ideas?
Tearing it apart this weekend.
